¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

$3,000 to $5,000 for an Automobile? You Don't Get Your Money's Worth

You don't because to-day most automobile **values** bear the same relation to automobile **prices** that **bicycle** values and prices bore to each other **twelve years ago.**

You paid $125 for a good wheel **then.** To-day you can buy a **better** one for 60 per **cent. less.**

Before you pay $3,000 to $5,000 for an **automobile,** find out what sort of a car the **Mitchell is at $2,000.**

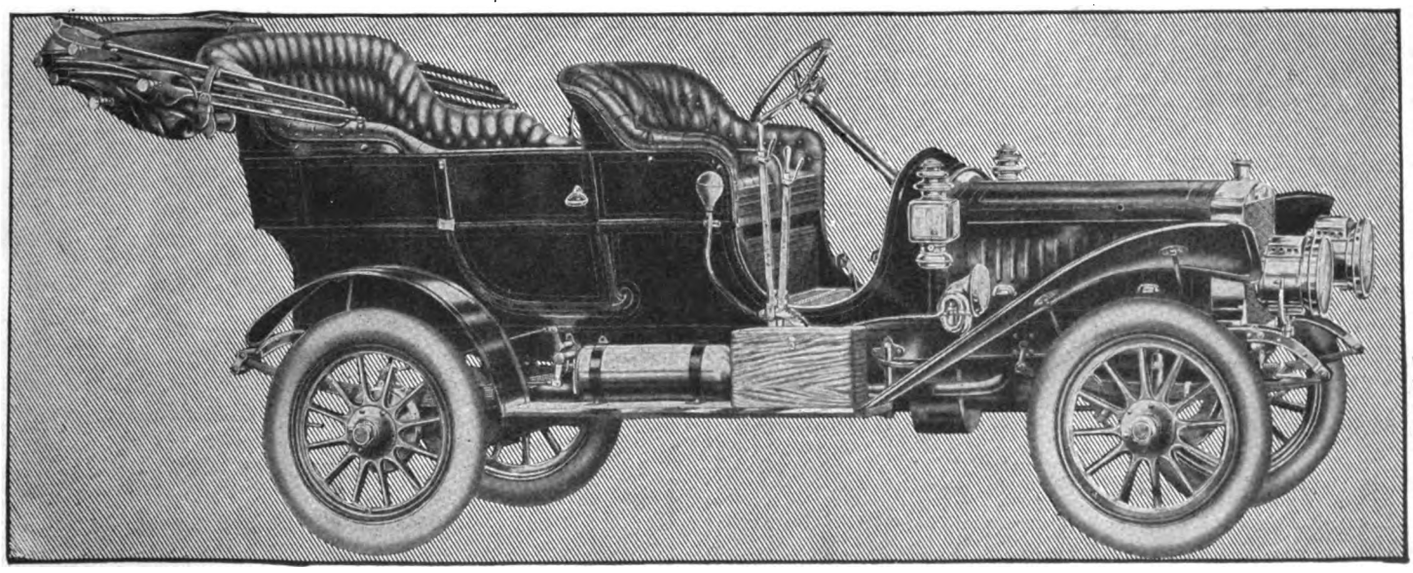
Don't take it for granted that $2,000 **can't** buy as good automobile value.

Prove that it **can.** Put **higher** prices on the **defensive.** Do it this way—

Try the Mitchell—any agent anywhere will be **glad** to "show you" a combination of style, finish, construction and performance in the Mitchell new models, the superior of which hasn't been "shown" in any car made to-day regardless of price.

He'll send a car around any time you say and show you a **silent argument** that will instantly appeal to your business judgment and **convince** you—a silent argument the equal of which no **salesman** ever will be capable.

Isn't saving $1,000 or $3,000 on an automobile which **proves** itself right **worth considering,** Mr. Business Man?



You simply telephone any Mitchell agent that you are interested (no obligation on your part) and want a demonstration.

Think it over, Mr. Business Man. Do you know a single, good, business-like reason **why** you should pay more than $2,000 for an automobile? Prove that there **isn't** any by writing us or the nearest agent for names of many satisfied users of the Mitchell who have driven their cars thousands of miles over all kinds of roads and hills, and have encountered every known road test that makes or breaks a car. Let them tell you facts in their **every-day experience** which proves the Mitchell to be the most economical car to **keep** as **well** as to buy.

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, February 20, 1908. No. 21

BUDLONG TO GO WITH PACKARD

Resignation as General Manager of the A. L. A. M. a Trade Surprise—His Successor not yet Named.

The fact that Milton J. Budlong, general manager of the Association of Licensed Automobile Manufacturers, has resigned that office to accept the assistant general management of the Packard Motor Car Co., Detroit, was made known early this week.

As it was known only to a limited few that Mr. Budlong even contemplated such a move, the news proved in the nature of a trade sensation, although a visit he made last week to Detroit furnished an inkling of it. The exact date when Budlong will take up his new duties is not fixed, as he will remain with the A. L. A. M. until his successor is chosen and well established in office. No one yet has been suggested to succeed him.

Although his change will excite general surprise, it is known that the Packard principals were negotiating with Budlong soon after his return from Europe last Fall, and that when he accepted the management of the A. L. A. M. in November, it was due to urgent solicitation and that to his acceptance were attached conditions that he should remain long enough to effect certain internal reforms and thereafter be free to go elsewhere, his personal inclinations being for effort in the manufacturing field in which he had spent the best years of his life. He since has had at least three unusually handsome proposals of the sort made to him and having accomplished the ends he sought to serve for the A. L. A. M., he has accepted the Packard proposal, which will make him the right hand man of Henry B. Joy, the managing head of the Packard company, who seeks to lighten his cares.

Previous to his engagement with the Association of Licensed Automobile Manufacturers, Mr. Budlong was president of the Electric Vehicle Co., and as the representative of that company he served as a member of the A. L. A. M. executive committee and president of the National Association of Automobile Manufacturers.

Credit Association in Annual Session.

At the annual meeting of the Automobile Trade Credit Association, held at the offices of its secretary and attorney, Franz Neilson, 80 Wall street, New York, all of the old officers were re-elected, as follows: President, W. B. Lasher, Weed Chain Tire Grip Co.; vice-president, Carl Kaufman; treasurer, M. J. Martin, George Haws Co.; secretary, Franz Neilson. These gentlemen, with E. S. Fretz, Light Mfg. & Foundry Co.; George L. Holmes, Jones Speedometer Co.; F. S. Wilson, Trenton Rubber Mfg. Co., and H. B. Mirick, National Electric Supply Co., constitute the board of directors. During last year it was reported that the association had been able to collect 75 per cent. of the old and doubtful accounts of its members. The total number of accounts handled was 863, of which 805 were collected, the total amount being $75,341, of which $56,801 was collected.

Witherbee to Establish Branch Houses.

The Witherbee Igniter Co., manufacturers of Witherbee batteries and Wico specialties, have just established a branch office at 720 Main street, Buffalo, N. Y. It will be under the management of James Barkley. A. J. Fisk, general manager of the Witherbee company, is now on an extended trip through the West, during which arrangements will be made for the establishment of a complete chain of branches.

Overland Issues More Stock.

The Overland Automobile Co., of Indianapolis, which emerged from its embarrassment by a semi-reorganization with J. N. Willys, its former Eastern agent, as president, has certified to an issue of $25,000 preferred stock. P. D. Stubbs appears as secretary of the company.

ELECTRIC VEHICLE AT STANDSTILL

No One Found Willing to Undertake Reorganization—Factory Closed, with no Prospect of Early Opening.

All prospects of an early reorganization of the Electric Vehicle Co., Hartford, Conn., have vanished. It is understood that efforts were made to induce two well known men to undertake the task, but in each instance the men refused and the last prospect of any further steps in that direction were dissipated this week when J. B. Entz, vice-president and chief engineer of the company, and E. C. Steinmetz, superintendent of the factory, were released. A few clerks and repairmen are still at work, but to all practical intents and purposes the plant is closed, and it is expected that the branch stores of the company also will be discontinued. In Hartford it is freely reported that there are small prospects of the stagnation being overcome until after the presidential election next Fall.

Henry W. Nuckols, one of the receivers of the company, stated that the practical suspension of operations is due to the improbability of immediate reorganization coupled with the fact that now there is no money coming in.

The receivers' report, filed in court, shows that at the end of January they had $21,951.44 in hand. Their expenditures during the month were $16,226.50. They collected $38,177.94 during January and paid out $16,226.50. They had $10,619 in hand on January 1, 1908.

The temporary receivers for the Electric Vehicle Co. were appointed on December 10, for four months. While this term expires on April 10, Mr. Nuckols does not believe that the court will at that time require a forced sale of the property, but will continue the receivership another four months.

There is a bare possibility, Mr. Nuckols

Digitized by Google

said, that the bondholders might bid for the property if it is put up at auction sale, but he added that he had had no such assurances. He did not believe, however, that the court would order a sale under present financial conditions, as the property would have to go at a great sacrifice, with a corresponding loss to the creditors.

Franklin Re-elects Old Officials.

Indications of improvement in business conditions is shown in the reports presented at the recent annual meeting of the H. H. Franklin Mfg. Co., Syracuse. In speaking of the year's business, H. H. Franklin, president of the company, said that the company sold its first car in June, 1902, and the total business for that year amounted to $122,000, while in 1907 the sales ran to nearly $4,000,000. In spite of the financial stringency orders kept up very well during November and December of last year. From January 1st to the 15th business was dull, but during the week of January 15 to January,21, 29 per cent. more orders were received than during the previous two weeks.

The following directors were elected by the stockholders to succeed themselves: H. H. Franklin, A. T. Brown, W. C. Lipe, E. H. Dann, G. H. Stilwell, John Wilkinson, and F. A. Barton. After the stockholders meeting the directors re-elected the following officers: President, H. H. Franklin; vice-president, G. H. Stilwell; secretary, F. A. Barton; treasurer, H. B. Webb. In the evening the stockholders of the company were entertained by Mr. Franklin at the Century Club.

Foreign Makers Turning to Air Ships.

From motor cars to flying machines is a far cry, it would appear, but it is not too far for some of the French automobile makers who are beginning to feel the effects of the popular revulsion from the craze for high priced machines, which has been the leading feature of the Gallic market for several years. Leon Bollée, one of the oldest motor car builders in the country, is reported to be engaged in the construction of a flying machine at Le Mans, and the Clement-Bayard Co., are reputed to be engaged in a similar undertaking at the instigation of a Russian enthusiast. It will be remembered that these firms stepped into the automobile business from the ranks of the bicycle industry at the time when trade depression was affecting the Continental cycle market.

Can't Sue Avery's Customers.

The United States Court of Appeals, at Chicago, has entered a decree sustaining the order of the lower court, which restrains the Commercial Acetylene Co. of New York from bringing suits against agents, customers, or users of automobile lighting equipment sold by the Avery Portable Lighting Co. of Milwaukee. The Commercial company claims that the Avery gas tank infringe their rights.

In the Retail World.

The Hibbard Automobile Co., Milwaukee, Wis., has dissolved.

Monterey, Cal., is to have a garage. Arthur Winston has purchased a lot on Main street, opposite Rodrick Park, and will erect a large reinforced concrete garage.

E. S. White and Linn B. De Bell have formed a copartnership and will open a garage in Adrian, Mich. The property at Church and Maumee streets has been purchased for the purpose.

The Wheeling Automobile Co., which has conducted a garage at Sixteenth and Eoff streets, Wheeling, W. Va., has been petitioned into bankruptcy. W. E. Weiss and others are the petitioners.

York—Nebraska, not Pennsylvania—now feels entitled to take rank with the "metropolusses" of the world. The York Automobile Co., the first garage in town, opened in the new Farmers' Exchange building last week.

Defective electric wires caused a lively blaze for a time in the three-story wooden garage of Walter O. Faulkner, Lynn, Mass., on Tuesday last, 11th inst. The only damage was to machinery, amounting to a little more than $1,000.

The Owensboro Automobile Co., which conducted a garage and repair shop at Owensboro, Ky., has gone out of business. Concurrently, a number of people are looking for W. R. Williams, the proprietor, who is said to have suddenly departed for Texas.

Howard Morley and Albert Marksheffel have organized the Colorado Automobile & Supply Co., and have opened a garage at 8-10 East Bijou street, Colorado Springs, Col. The company will handle the Ford car, and has announced that it will organize a supply club by which members may secure supplies at actual cost.

The Week's Corporations.

Ossining, N. Y.—Ossining Garage Co., under New York laws, with $5,000 capital. Corporators—G. Howard Wallace, Samuel J. McCord, and Thomas E. Wilson, Peekskill, N. Y.

Chicago, Ill.—Co-operative Engineering Works, under Illinois laws, with $10,000 capital, to manufacture automobiles and supplies. Corporators—F. W. Ritchie, J. Smalley and G. E. Schmidt.

New York City, N. Y.—Stepney Spare Wheel Agency, under New York laws, with $4,000 capital. Corporators—John C. Riley, Chicago; Stephen A. McMahon, Belleclaire Hotel, and L. Walter Lissberger, 135 East Ninety-second street, New York City.

Kittery, Me.—Ball Bearing Tire Co., under Maine laws, with $7,000 capital; to manufacture and deal in automobile tires. Corporators—Edward N. Cook, Providence, R. I., president; Ira F. Peck, Auburn, R. I., treasurer.

Yonkers, N. Y.—Rose & Thomson, under New York laws, with $10,000 capital, to carry on automobile business and conduct a garage. Corporators—Arthur S. Thomson, New York City, N. Y.; Herbert Rose and Louis F. Marran, Yonkers, N. Y.

Larchmont, N. Y.—Holbrook-Singer Co., under New York laws, with $15,000 capital; to manufacture automobiles, etc. Corporators—Henry F. Holbrook, 58 West Fifty-ninth street, New York City; Charles A. Singer, Jr., and David J. Levett, Larchmont, N. Y.

Jury Gives Verdict Against Vanderbilt.

Francois Richard, a Frenchman, who built a racing automobile for Alfred Gwynne Vanderbilt, the only fault of which was that it would not run, secured a verdict of $1,250 against his former employer, by a jury in the Supreme Court, New York City, this week. Richard had sued for $5,000, which he claimed was the balance due from Vanderbilt for constructing the vehicle. It was brought out in the suit that Vanderbilt had employed Richard to build a car that would break all existing speed records, agreeing to pay him a salary of $5,000 a year, in addition to the cost of materials employed in the construction of the car.

The car, rated at 200 horsepower, was built and taken to the Florida beach carnival in 1906, but it did not break any records; in fact, it could not be persuaded to move under its own power for any distance. Some of Richard's expense items were rather high and Mr. Vanderbilt would not pay them, when Richard sued for $5,000, the unpaid balance of $19,000, the cost of the machine. In court it was brought out that Richard charged $1,300 for a crank shaft that cost him $600, and that in his bill was an item of $1,400 for expenses at Florida, during the racing week. Richard explained that he met a "very many Frenchmen in Florida." The jury was locked up many hours before returning a sealed verdict in favor of the plaintiff for $1,250.

Breaks Away from Horsepower Rating.

While automobile manufacturers have discussed the subject, it has remained for a maker of motorcycles to break away from the slavish, elastic and too often meaningless term "horsepower." The makers in question, the Hendee Mfg. Co., Springfield, Mass., who produce the famous Indian motorcycles, have announced that henceforth they will employ piston displacement instead of horsepower in rating of their engines, and emphasize their statement by so designating the power of their several models in their 1908 catalog.

Rushmore Obtains Another Injunction.

The Rushmore Dynamo Works have obtained a preliminary injunction, restraining the Motor Car Equipment Co., New York, from using the words "Flare front" or the name Rushmore, and from the manufacture and sale of lamps in imitation of the Rushmore product.

ODD SETTLEMENT OF SHOW SNARL

Trouble Caused by San Francisco Women's Project is Eased—"Ins" are In; "Outs" Must Stay Out.

Although the Automobile Dealers' Association of California at its last meeting refused to sanction the proposed show of the California Woman's Automobile Club, as it was expected would be the case, the show promoting ladies are not the least bit worried and will conduct the exhibition as planned. It is advertised to take place in the Coliseum, during the week March 8 to 8.

As told in last week's Motor World, the trade association, by a majority vote, sometime ago decided that it would not be to the general interests of the dealers to hold a show this year. The dealers that did think it to their interests to hold a show were considerably put out by the decision of the association, and when the feminine motorists came forward with a project to hold a show under the auspices of their club, the idea was hailed with delight and many of the dealers promised to support it

When it was announced that the women would apply to the trade association for a sanction for their show and that the question would come up for discussion and action at the last meeting it was predicted there would be "tall doings." Unusual would better describe the action taken.

After a great deal of discussion and lively argument it was decided to not grant the sanction to the California Woman's Automobile Club. This action was followed by the adoption of a rule which considers all shows not sanctioned by the association as outlaw events. At first the rule, as proposed, was most drastic. It would have prohibited those who took part in such events from taking part in all future contests and shows, and for a time it looked as though there would be a split in the association. The rules were amended, however, to allow those dealers who already had taken space in the proposed woman's show to take part in that one only and to "be good" in future. It also prevents any more dealers signing to exhibit at the show, giving power to the directors of the trade association to penalize them according to their discretion. The situation is very much muddled. Those dealers who did not purchase space to exhibit now are barred, while those who ignored the dealers' association's previous action and said that they would show whether a sanction was given or not, have been granted immunity, and will be able to display cars at the show. There are those who rightly think that it is a poor rule that won't work both ways.

The California Woman's Automobile Club issued a prospectus this week which indicates that most of the spaces have been taken. The cars which will be shown are the Dragon, National, Jackson, Renault, Aerocar, Stearns, Tourist, Locomobile, Matheson, Winton, Elmore, Stevens-Duryea, Woods, Maxwell, Acme, Overland, Marion, Glide, Gale, Auburn, Chadwick, and Frayer-Miller.

Why Budlong is not Wholly Happy.

Milton J. Budlong is one of the incorporators of the Leakless Motor Tube Co., which was this week incorporated under New York laws, with $60,000 capital. Budlong was not aware of the honor that had been thrust upon him until friends informed him of the fact, and then he was not wholly happy. It appears that when he was abroad last Fall and before he became general manager of the Association of Licensed Automobile Manufacturers, an English acquaintance informed him of his intention of forming an American company to market the "Sure Seal Compound" on this side of the pond and asked if Budlong would permit the use of his name in forwarding the project. Budlong proved agreeable, but that he would figure as one of the organizers of the company never entered his mind, hence his present discomfiture, which is made keener because his British friend who came to America, has just sailed for home, thus partly closing Budlong's relief valve. Edmund S. Hopkins and Dr. Ottey Miller are named as the other corporators of the Leakless company. Budlong, however, does not consider himself a corporator, as he signed no papers and had nothing whatever to do with the matter.

Wagner Leaves the "Motor Age."

As a result of its acquirement of the Chicago Motor Age by the owners of the New York Automobile, Fred J. Wagner, the general advertising representative of the Chicago publication, has been released. Wagner is one of the best known men in his field, his connection with the Motor Age dating back nearly 20 years and from the period when that publication was first The Bearings and later the Cycle Age.

Mitchell Rental Service in New York.

The Mitchell Motor Car Co. of New York has instituted a rental department. The Mitchell touring cars which will be rendered available for the service will be rented, however, only with one of the Mitchell company's regular drivers. The rates that will apply are as follows: Per hour, $5; six consecutive hours, $25; one week day (10 hours), $35; one week (six days), $150; one month, $500.

Shift of Fisk Branch Managers.

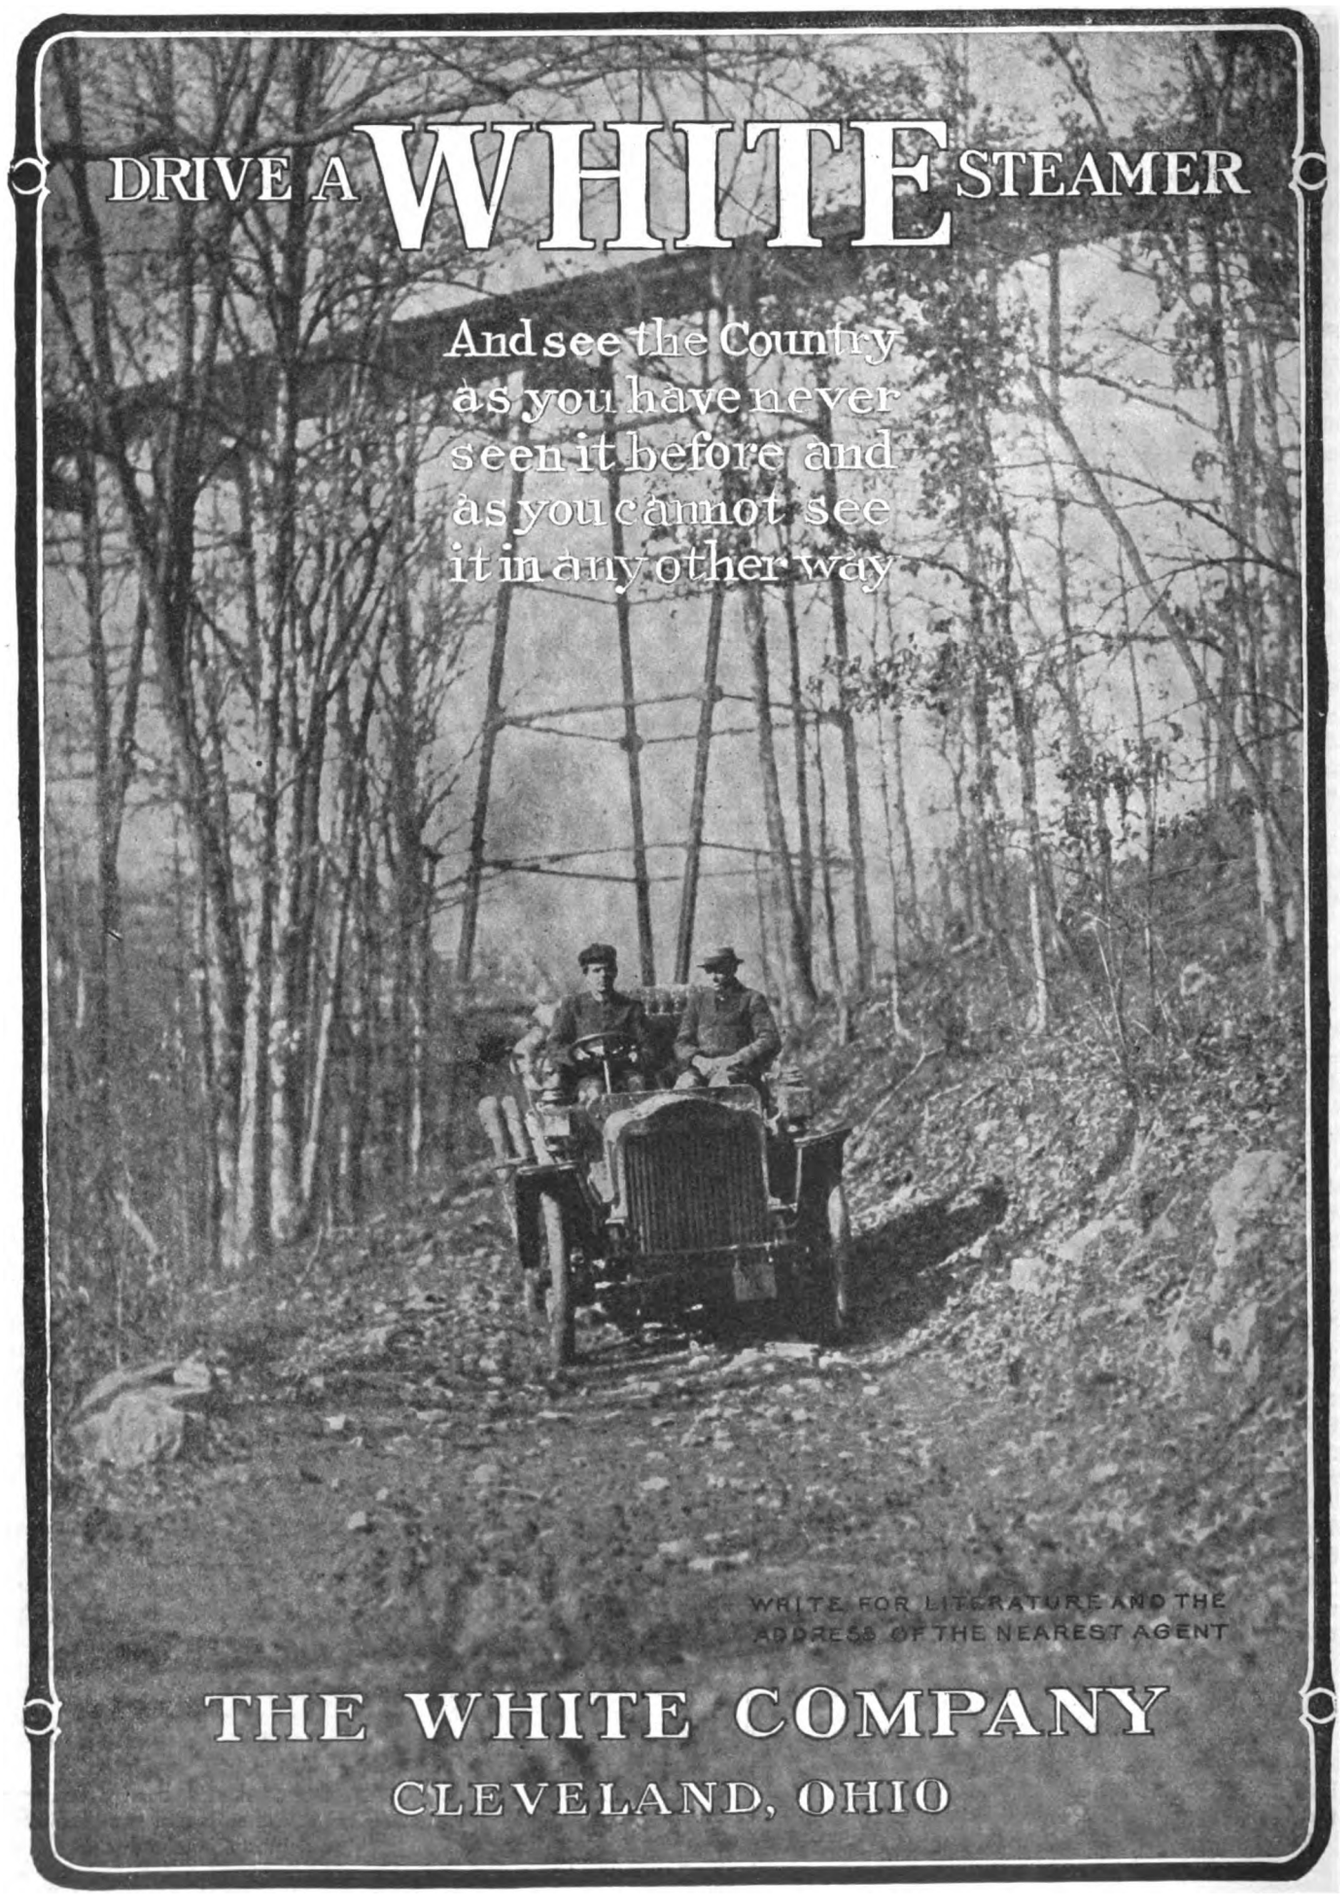
W. J. Lamb, who several months ago was transferred from management of the Fisk Rubber Co.'s Detroit store to the corresponding position in the New York branch, has returned to the Detroit post. The vacancy in New York has been filled by the transferral of J. B. Kavanaugh.

REORGANIZATION OF THE ROYAL

Receivers Recommend Capitalization of Its Indebtedness—Fate of Company to be Decided To-day.

If the recommendations of the committee of three, appointed by the receivers, are carried out, the Royal Motor Car Co., Cleveland, Ohio, will be reorganized by the creditors' acceptance of stock in payment of their claims. The committee, was composed of Charles E. Adams, vice-president Cleveland Hardware Co.; S. F. Haserot, president The Haserot Canneries Co., and formerly chairman of the board of directors of the Royal Motor Car Co., and F. A. Scott, secretary and treasurer of the Superior Savings and Trust Co., which latter institution is the receiver for the Royal company.

Previously, the estate had been subject to appraisal as a going concern, and was found to be worth $397,833.67, the most valuable items being as follows: Cars at factory and in agents' hands, $89,828.40, raw material and parts, $98,762.48, machinery, $91,784.35, equity in buildings, etc., $55,725.82. The schedule in bankruptcy had placed the total assets at $443,959.59, and the liabilities at $510,832.12. Of the latter amount $261,092.65 was represented by notes payable, and $164,744.68 by accounts payable.



Of the 400 creditors, the claims of 235 are for sums of $100 or less, aggregating $6,000, which the receivers' committee advises be paid in cash, and that the property then be sold to "a new corporation composed of the creditors" by the issuance to them of preferred stock, the entire control of the company to remain with these creditors until 50 per cent. of the proposed preferred stock shall have been retired.

The committee lays stress on the fact that the appraisal is based on the value of the property as a going concern and points out that the real estate and plant are held under a land contract from a syndicate on which there already is a default. The syndicate is therefore in position to foreclose at any time. The equity in this land contract that would be lost to the creditors through foreclosure proceedings, is $80,725.82.

The committee also points out that included in the item of $98,762.48 of automobile parts and raw material scheduled by the appraisers, is an allowance of $10,000 for parts for Model "M" car, which parts cost the company approximately $67,000; but as the car has never been completed and marketed, the parts will become absolutely valueless unless put into the form of a finished product.

The fate of the company probably will be decided at a meeting of the creditors which is being held in Cleveland to-day.

The Press and the Price-Cutters.

If legitimate dealers were asked what one factor serves most seriously to disturb the retail trade, there is small doubt that the great majority of them would specify price-cutting. When prices are cut, all values are unsettled, and every dealer is placed on the defensive and his sales are rendered much more difficult. It is bad enough when prices are cut secretly, but it is when the cut prices are published and thus spread broadcast that real and widespread damage is done.

As a rule the man who makes a business of cutting prices is a cunning individual who has no real or lasting regard for or interest in the trade. He will forsake it the moment he has squeezed the orange dry. As a general thing, the goods he announces in spreadeagle fashion are doubtful goods —goods that are ante-dated or "off color" in some way; frequently they represent purchases of bankrupt stocks, which implies that replacements of parts will be impossible. Occasionally, such merchants lay hands on goods of unquestionable repute and condition and it is then that they shriek loudest and advertise boldest. Generally speaking, such goods are secured from a disgruntled agent who, because of a dispute with the manufacturer, hopes to "get even" and to injure the latter by unsettling his values. Several instances of this sort recently have occurred, and though the number of the articles obtained was small, the price-cutter advertised in a manner that made it appear as if his stock was unlimited.

With few exceptions, the publications in which such advertisements have appeared are the very ones that express an almost holy love for the automobile industry. The manufacturer and the dealer who are courted assiduously, pay their good money and if they receive a little gratuitous "soft-soap" in the reading columns, they overlook entirely the spreadeagle advertisement of the price-cutter which, in another column, or the same column, does damage to them and which minimizes or nullifies their announcements. This sort of thing is bad enough on the part of the daily press, but when the automobile publications themselves open their pages to the price-cutter, it is time for protest. The damage done by a questionable advertisement in a daily paper is largely localized. When it appears in a trade paper it is spread over a great expanse of country. The seed of trouble is planted and values unsettled in hundreds of places. Hundreds of dealers are affected.

It is not to call attention to the fact that the Motor World never has solicited a cut-price advertisement, or permitted one to appear in its columns, but because other papers which are prone to call attention to their virtues, have done and are doing that very thing—some of them even permitting the advertisements to appear on their "bargain price" pages, while their regular and legitimate patrons are obliged to pay full rates. It would seem that ordinary regard for the health of the industry and fair dealing toward the manufacturers and dealers who enable them to exist would inspire the eradication of disturbing factors—and there is no question regarding the disturbance caused by the publication of cut prices. The industry has a right to expect that its interests will be conserved and protected by its own organs. It is a fair assertion also that when manufacturers have bargains to dispose of, they should give their own agents or other legitimate customers a chance to purchase and dispose of them in the regular channels before having resort to professional price-cutters, whose practices always are injurious.

Horsepower vs. Piston Displacement.

What a motorcycle manufacturer has done, some automobile manufacturer should have courage enough to do, i. e., break away from the slavish, elastic and unmeaning, if time honored, term "horsepower."

Fame awaits the man who places the rating of his engines on a definite and unfanciful basis; and piston displacement is a basis of the sort. It affords no room for guess or subterfuge and aside from affording purchasers known values and unfailing comparisons, it is a basis that places designers on their mettle and holds them up to their work. When of two engines having the same displacement one proves of superior power, the evidence is irrefutable that there is something lacking somewhere in the men or the mechanical makeup responsible for the other engine.

Piston displacement several times has been discussed by automobile manufacturers. It is now time that one of them passed the talking point.

Fuel Problem and Its Influence.

How much of popular misconception is covered by the prevalent term gasolene, is not generally appreciated. How much remains to be learned of the properties of the ideal fuel is even less readily comprehensible. As set forth in another column, it appears that changes in market conditions, governed chiefly by the rapid and lusty growth of the motor industry, have so altered the status of the ordinary fuel of commerce as to render the former test by specific gravity of no avail. The fact that this is but an outward indication of a vastly more significant change which is destined to come is not as easy to appreciate.

The importance of the fuel problem is generally admitted. Sooner or later it is likely that gasolene as such will become too expensive to be of practical value to the ordinary user. A new standard fuel will have to be adopted, and its adoption will involve certain changes in engine design which though not material from the ordinary point of view, yet must have great effect upon the question of efficiency, or,

Digitized by Google

roughly, upon the amount of plant required to produce a given unit of power. Not until a fuel can be chosen which may be regarded as reasonably permanent will it be possible to fix upon standards of design as absolute and exact. Meanwhile much remains to be accomplished in the study of conditions governing the actual behavior of the fuel in an intimate way.

Concerning the Glass Front.

Affording protection from the elements to the driver of a car is a problem, the solution of which is as difficult as it is important. Though the glass front does afford protection from the wind, it is not entirely practical for the purpose of keeping out the rain or snow, for while it will serve that end, it also offers a surface to which moisture adheres with the consequent result that it becomes translucent instead of remaining transparent. This, of course, prevents the closest observation of traffic conditions, so essential to the careful operation of a car through crowded streets where distances must be actually figured by inches and allowances made in time to prevent accidents.

In fair weather the glass front, as now generally constructed, offers an ideal protection from the wind. The earlier types of this had a serious defect in that they were constructed for use on limousine bodies, with a wood panel 3 or 4 inches wide, and when in place in the frame of the car offered an obstruction to the vision in the form of a solid piece of frame work 6 or 7 inches in width. This obstruction shut off a wide angle of the road and vehicles within that field could not be seen unless the driver kept moving his head and body from side to side, which was inconvenient and sufficiently objectionable to be considered a strong argument against the use of the glass front as then arranged.

Experience quickly showed that this objection must be overcome. As a result the wood frame gave way to a small brass rod and as this offered no visual obstruction it has come to be generally adopted and with entirely satisfactory results so far as the subject of glass as a wind shield is concerned.

While it is essential to the comfort of the occupants of the front seats that they should have protection from the snow and rain, and while it is desirable that the dashboard accessories should be kept dry, it is vastly more important that a driver should have an unobstructed view of the roadway and its surroundings, a more comprehensive view than can be obtained through moisture covered glass. The solution is not easy, but it may be that this can best be obtained by a slight change in the design of the car body, in the case of limousines, or in the top, when one has in mind the touring car. The necessity of driving with the view unobstructed by translucent glass would be done away with if the glass came only so high as to be a little below the level of the eyes, and if this arrangement was supplemented by the overhead protection, either standing or cape top, having arranged on it a sort of a visor or peak which projected from the top outward and down to a point where its lowest extremity would be slightly above the level of the eyes and some distance in advance of the glass, an adequate protection would be afforded from wind and wet and nothing would be introduced between the road and the eyes.

To those who find that glass is undesirable, because of a possibility of accident where it may be broken and personal injuries be sustained by coming in contact with the jagged edges, this idea of the visor and, shall we say, "half front," can be further carried out by substituting a wood panel for the glass, as either the one or the other serves to protect and the position of either is such that it is looked over, instead of through.

While practically every inn and road house of any pretensions is striving for the patronage of the automobilists, there is one phase of the situation which is practically overlooked and that is provision of suitable accommodations for the chauffeurs. The fact that the drivers are employes instead of principals, is neither reason or excuse for treating them as the menials of the establishment in which they may seek refreshment, and as, in most places, the food served them is charged for at the same price as that served to "milady" in the dining room, they are justified in expecting and demanding that surroundings and attention be given them to the end that they may have their meals, for which they pay, served in a place apart from "kitchen help."

A sub-committee of the A. A. A. racing board now is engaged in revising and otherwise overhauling the rules. If the committee decides to continue the stultifying and inconsistent rule whereby an amateur may compete for cash or against professionals and yet remain an amateur, it is hoped that an explanatory chart or diagram will be permitted to accompany the rule in order that the manner in which the reversal of the world's understanding of amateurism was accomplished may be made plain. It will be a good idea also to include in a footnote, the reasons why, simply because they are engaged in the trade, Messrs. Henderson, Clifton and Briscoe, the heads of the three trade associations, for instance, must line up in the professional class as side partners of Barney Oldfield, "Red" Flanagan, "Micky" O'Toole, and the rest of the cash-chasing "sportsmen."

COMING EVENTS

February 21-29, Newark, N. J.—New Jersey Automobile and Motor Club's and New Jersey Automobile Trade Association's annual show.

February 22, Houston, Tex.—Houston Automobile Club's race meet at Harrisburg track.

February 22, Boston, Mass.—Bay State Automobile Association's 150 miles endurance run to Providence, Worcester and return.

February 24-29, Lincoln, Neb.—Dealers show in the Auditorium.

February 24-29, Portland, Me.—Annual show in the Auditorium.

February 25, Brooklyn, N. Y.—Long Island Automobile Club's 242 miles economy run to Montauk Point and return.

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 2-8, San Francisco, Cal.—California Woman's Automobile Club's show in Coliseum.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

March 18-25, Rochester, N. Y.—Rochester Automobile Club's show in new Convention hall.

March 15-April 1, Omaha, Neb.—Omaha Automobile Dealers' Association's annual show in the Auditorium.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

MANY CARS STAGED AT CLEVELAND

Annual Show the Best the City has Seen—The Decorative Scheme a Dream in White and Gold.

White and gold, always a striking combination rich in harmony, forms the basic color scheme of the Cleveland show, which is "holding the boards" in Central Armory this week. Judicious distribution of more than 7,500 incandescent bulbs heightens the artistic effect, and added to the whole, the restful effect of uniform signs make the present show the "prettiest ever" in Cleveland, or, at least, such is the locally expressed opinion.

The doors were thrown open on Monday night, and the show will continue throughout the week. The Cleveland show is, perhaps, one of the most important of the many numerous local exhibitions. At the present show no less than 68 exhibits, of which 38 are accessories, are displayed. The 29 agencies and branch houses are showing 39 different makes of cars, a striking illustration of the extent of the automobile trade in Cleveland. The exhibitors are as follows:

H. S. Moore, Stoddard-Dayton; Chisholm-Phillips Auto Co., Stevens-Duryea; Elmore Motor Car Co., Elmore; The White Co., White; Peerless Motor Car Co., Peerless; Rauch & Lang Carriage Co., R & L electric; Garford Motor Car Co., Garford; Price Bros. Carriage Co., Baker; R. H. Magoon Motor Car Co., Chadwick, Jewel and De Luxe; Hall Bros., Cartercar; Gaeth Auto Co., Gaeth; Ohio Motor Car Co., Stearns, Cadillac, Columbia; Metropolitan Motor Car Co., Pierce; Winton Motor Carriage Co., Winton; Standard Automobile Co., Packard and Buick; Oldsmobile Co., Oldsmobile; Woods Motor Vehicle Co., Woods, Leonard Motor Co., Jackson; Byrider Electric Auto Co., Byrider; Oakland Motor Car Co., Oakland; Brush Runabout Co., Brush; Wentworth Motor Car Co., Mora and Ford; C. M. Cachat & Co., Wayne; Reese Motor Car Co., Columbus, Royal and Corbin; George S. Patterson, Reo and Premier; T. C. Whitcomb Auto Co., Rambler; Studebaker Automobile Co., Studebaker; Auto Shop Co., Thomas and Franklin; Cuyahoga Motor Car Co., National.

Fisk Rubber Co., Standard Welding Co., Collister & Sayle, Veeder Mfg. Co., George A. Rutherford Co., Charles E. Miller, S. F. Bowser & Co., Inc., Diamond Rubber Co., B. F. Goodrich Co., Goodyear Tire & Rubber Co., American Ball Bearing Co., J. P. Davies & Co., National Carbon Co., Echo Horn Co., Auto & Supply Co., Cleveland Tanning Co., N. Y. & N. J. Lubricant Co., Austro-American Separator Co., Hartford Suspension Co., Columbia Refining Co., Perfection Spring Co., Gabriel Horn Mfg. Co., L. J. Mueller, Howe Scale Co., Jones Speedometer Co., Ohio Rubber Co., Simpson & Gray, Warner Instrument Co., Continental Agency Co., Gerro Machine & Foundry Co., William Taylor & Co., Non-Explosive Safety Naptha Retainer Co., Sprague Umbrella Co., Crawford & Soper, K. & W. Ignition Co., Westinghouse Electric & Mfg. Co.

Pope Receivers Report a Busy Month.

According to the report of the receivers, filed in the court, the cash receipts of the Pope Mfg. Co.'s Hartford factory during January amounted to $141,382.66, while the months disbursements totaled $129,409.91. Including $11,284.31 carried over from December, the cash balance in Hartford banks is $23,257.06.

The chief sources of receipts were from collection of account and notes receivable $12,920.99, receipts from sales $123,868.10, and from deposits by customers on orders for automobiles $2,425. The cash disbursements were as follows: Refund of deposits received on miscellaneous undelivered orders, $144.51; receivers' expenses and payments for purchases, $126,248.33; premium on receivers' bond, $200; traveling and special advances, $825; advances for pay rolls and expenses and payments on accounts to receivers in Massachusetts, Maryland, New Jersey, Illinois, Missouri, New York, Pope Motor Car Co., $1,992.07.

Accrued liabilities of receiver for materials, supplies and miscellaneous expenses $36,636.89; for pay rolls, factory and office, $7,680.15; total, $44,317.04.

Balances due receivers of Pope Mfg. Co. and Pope Motor Car Co. in other districts, $14,720.95.

Accounts receivable from sales of receivers, December 31, 1907, per last report, $97,709.77; sales by receiver for month of January, 1908, $129,409.19; total, $227,418.96, less cash collections for month of January, $123,868.10, and deposits credited to accounts receivable, cash discounts and miscellaneous contra accounts ($9,483.38) $133,351.48, leaves total $94,067.48.

Balances due from receivers of Pope Mfg. Co. and Pope Motor Car Co. in other districts for transfer of merchandise and supplies and advances for expenses, $6,126.29.

Australia a Promising Market.

Australia is likely to furnish a good market for American automobiles, if the trade is properly handled from now on, and efforts made to supply a product in which reliability in operation is a prominent feature, according to Harry R. Burrill, special agent of the Department of Commerce and Labor, who has made an extended investigation of foreign trade conditions. Contrary to what might be expected he says that "there is no prejudice observable in favor of England because she is the mother country, and products from her factories must compare favorably in cost with those of competing nations or she will lose the trade."

CALLING A HALT ON CONTESTS

Their Frequency Prompts Chicago Dealers to Limit Their Entries—Members of Motor Club Take Offense.

Believing that a multiplicity of automobile contests is too great a drain upon the resources and time of the average dealer, the Chicago Automobile Trade Association has decided that it will call a halt by simply withholding entries until all conditions are found to be more favorable. Members of the Chicago Motor Club, which has taken the initiative in promoting contests in the Windy City for the past two years, think the action of the dealers is a direct slap at them because of the differences which grew out of the 600 miles endurance run held just before the Chicago show.

Thomas Hay, manager of the Ford branch in Chicago, caused the resolution to be brought before the notice of the dealers when at the last meeting he suggested that, before the dealers enter any more contests, they withhold their entries until a special committee of the Chicago Automobile Trade Association shall have reported as to the advisability of entering such proposed contest. If the conditions of the contest and the entry fee, besides the feasibility of it, appeal to the dealers then they will enter, with the provision, however, that the club promoting such contest shall report to the association upon the financial results after it is held, a proceeding that doubtless will be balked at by those individuals or organizations promoting automobile contests.

According to Windy City reports automobile contests are becoming too numerous for the dealers, and this was their chief argument in support of the Hay resolution. Two or three interesting, sensible contests during the season are stimulating to the trade, they aver, but numerous contests are too great a drain upon the dealers in return from the benefits they receive from such contests.

The action of the trade association has provoked considerable discussion and comment in Chicago. The dealers say that in passing the resolution they are looking to their own interests, and that if they did not take action of the sort it would not be long before they would have to give up selling cars and take to competing in contests all the time. On the other hand, some of those interested in the Chicago Motor Club think that the resolution was directed straight at them on account of the late endurance run, at the conclusion of which the technical committee split hairs in an effort to arrive at the winner, when nearly a dozen cars finished with perfect scores, and all but one were finally ruled out because of some minor technicalities that had no bearing upon the enduring qualities of the cars affected.

RACING RULES TO BE REVISED

Special Committee Appointed by the A. A. A. Racing Board—Action Taken on Wilkes-Barre Prize Hold-up.

Besides the appointment of a special committee to revise the racing rules, and a notification to the Wilkes Barre Automobile Club to deliver a prize which it has thus far failed to do, nothing else of importance was transacted at the first meeting of the new racing board of the American Automobile Association, held in New York City Saturday last, 15th inst.

Chairman Jefferson DeMont Thompson presided at the meeting, which was attended by eight of the other twenty-nine members, those present being A. R. Pardington, Brooklyn; Charles J. Swain, Philadelphia; A. L. Riker, Bridgeport; A. B. Lambert, St. Louis; Alfred Reeves, A. G. Batchelder and S. A. Miles, New York City, and Louis R. Speare, Boston.

The board sent word to the Wilkes-Barre Automobile Club, of Wilkes-Barre, Pa., that unless it sent to Walter White, of Cleveland, within thirty days, the prize in the free-for-all event at its hill climbing contest held on May 30th last, the club would be suspended from all sanction privileges until the prize was delivered. This action was in the nature of upholding a decision of the 1907 racing board, which had decided that the Wilkes-Barre club had no right to exclude White from the free-for-all after it had accepted his entry for the event.

Considerable time was spent in discussing the racing rules both at the regular morning session and at the supplementary afternoon session. Chairman Thompson, A. L. Riker, Alfred Reeves and S. A. Miles were appointed a special committee to revise the racing rules.

This special committee met on Tuesday, this week, and worked all day without completing their labors. Another meeting was called for the following day, following which it is expected that the new racing rules will be ready to be made public.

Although no official announcement has has yet been issued, Frank B. Hower, president of the Automobile Club of Buffalo and chairman of the touring board of the American Automobile Association, who is in New York City at the present time, is said to have stated that the annual Glidden tour will this year start from Buffalo, during the week beginning July 6. The Buffalo organization has made an appropriation to care for a two days' good roads convention which will be held in Buffalo probably on July 6 and 7. If these dates finally are decided upon it is probable that the annual Glidden tour will leave from that city upon the day folowing the convention. The exact route of the tour has not been decided but will probably lead to Pittsburg, Philadelphia, New York, New Haven, Boston and to the White Mountains. The rules for this year's tours are now being drafted.

Wilkes-Barre to Repeat Its Climb.

Although it has not yet delivered the prize in the free-for-all event in its hill climb last Decoration Day to Walter C. White, whose protest that he was entitled to the prize, for although he had been barred from the event, his car made the fastest time of the meet, was upheld, it is evident that the Wilkes-Barre (Pa.) Automobile Club intends to do so. This supposition is based on the fact that the Pennsylvania club this week announced that it would repeat the annual climb on May 30th, this year, which it cannot do if the prize is not delivered within thirty days, according to a decision of the racing board of the American Automobile Association. The announcement that the Wilkes-Barre Automobile Club will repeat the climb was made at the annual meeting, when the following new officers were elected: President, George F. Lee; vice-president, Lyman H. Howe; secretary, Dr. E. C. Wagner; treasurer, Peter A. Meixell; executive board member, W. E. Steelman.

For the Federal Registration Bill.

Thursday, March 12, has been set as the date for the hearing on the federal registration bill, designated as "House Bill 428," which the American Automobile Association has succeeded in having introduced at the present sesion of Congress. The Judiciary committee of the House, to whom the bill was referred, will listen to arguments upon it, the hearing beginning at 10:30 a. m., of the date stated. Preliminary to this hearing a conference of the delegates of the various clubs and associations will be held at the New Willard hotel, in Washington, at 8:30 p. m., March 11th, and every club and affiliation of the American Automobile Association is being importuned to be represented by delegates on the dates mentioned. On Thursday evening the Automobile Club of Washington will informally entertain the visiting delegates at their club house. That the bill stands an excellent chance of passing both the House and the Senate is the belief of Hon. R. C. Moon, who is on the Judiciary committee,

American Entry for Grand Prix.

America will be represented in the famous Grand Prix race of the Automobile Club of France, which is to take place over the Dieppe circuit early in July, the date having not been definitely fixed. Just before the entries closed on Saturday last, E. R. Thomas cabled the entry of a Thomas car, to be driven by Montague Roberts. According to report the car which Roberts will drive in the French race will not be a racing car, but a model of the stock car he is to drive in the Briarcliff trophy race, if the latter event takes place. It is stated that Roberts will sail for Europe early in April.

FLORIDA SAND FEST A CERTAINTY

Official Announcement Settles Doubts—Chairman Morrell Claims 28 Entries, but Names only Twelve.

The Florida beach carnival will take place during the week of March 2 to 7, despite reports that its fate was uncertain. All doubts about holding the annual sandfest were set at rest Monday when the contest committee of the Automobile Club of America made the definite statement that the meet would take place during the first week of March as advertised.

R. Lee Morrell, chairman of the contest committee, said that so many conflicting rumors have been in circulation that many dealers and manufacturers have refrained from entering cars, and in order to give them a chance, the date of closing the entries has been postponed until February 29th. It will be remembered that Morrell some time ago postponed the closing of entries for the proposed Briarcliff trophy race for much the same reason.

It also was announced that a special compartment club car for the accommodation of contestants and members of the club will leave New York City on Saturday, 28th. It will be due in Ormond at 11.57 p. m. Sunday.

Although Mr. Morrell stated that he had received "no less than twenty-eight entries," only twelve were made public, as follows:

Maurice G. Bernin, 60 Renault; Emmanuel Cedrino, 60 Fiat; E. B. Blakeley, 130 Christie; H. B. Shefts, 120 Hotchkiss; John B. Ryall, 120 Woolsey; R. W. Buckley, 110 B. L. M. or Fiat; R. G. Kelsey, 50 Haynes; W. Gould Brokaw, 50 Christie; E. B. Blakeley, 30 Allen-Kingston; James Loughlin, 3d, 30 Cleveland; John J. Ryan, 90 Stearns, and P. W. Strong, 60 Welch.

In the 228 miles event for the Automobile Club of America's cup, the Renault, Christie, Fiat, B. L. M., Haynes and Woolsey cars have been entered. The same cars, with the exception of the Haynes will take part in the 100 miles race. The entries for the stock car race are a Welch, Haynes, Christie and Allen-Kingston. All the high powered cars will try for records.

As an extra feature, three events for motorcycles have been carded, at one, five and ten miles. It is stated that ten entries have been received from the Indian, Curtiss, M-M, and Peugeot representatives.

Averages 83 Miles per Hour.

Charles Jarrott has set up another staggering record on the Brooklands motor track in England. On February 5th he covered 50 miles in 36.05 76-100, an average of 83 miles per hour. The former record was 37.45 9-10. Jarrott had intended to try for the hour record, but a punctured tire stopped him.

LONG WINTER TEST ON HIGH GEAR

Counselman Driving Over 3,000 Miles of Snow—Not Even the Reverse Speed Available for Hills.

Sleigh riding is out of date, snow riding in an automobile is nothing new, but when such latter ride is attempted with all the gears but the high removed the performance smacks of the unusual. Such is the trip that has been undertaken by a Thomas Detroit car, which appropriately has been dubbed the "Snow Bird."

The "Snow Bird" left Detroit in charge of Lee Counselman, sales manager of the Thomas-Detroit Co., and is zig-zagging around the country wherever snow may be found. It is planned to cover 3,000 miles on the high speed before the mid-winter trip ends.

Long distance runs on one gear have been made before, but this is the first time a journey of the sort has been attempted in mid-winter, with all the gears but the high removed from the car. In the "Snow Bird" there absolutely is no low speed, intermediate or reverse, the latter having been removed so that it would not be possible to back the car up hills, a resort, that has been tried, it is claimed, where only the low and intermediate gears have been removed.

The start was made early this month from Detroit. Counselman was in the driver's seat and he will take the car to Toledo, where it will be turned over to C. B Hills, who is connected with the engineering department. When Counselman left Detroit a severe blizzard was in progress, with a foot of snow on the ground, and the temperature bordering uncomfortably close to zero. Before the unique test shall have ended it is expected the car will have buffetted snow banks in five States, passing through Toledo, Marion, Columbus, Springfield, Dayton Cincinnati and Hamilton, in Ohio; Richmond, Indianapolis, Kokomo, and Logansport in Indiana; Chicago and other cities in Illinois, Milwaukee in Wisconsin, then backtracking to Chicago, and around the lake front to Grand Rapids, from where it will return to Detroit.

PICTURESQUE SCENE ON THE ROUTE OF THE "SNOW BIRD"

Testing Automobile as Dispatch Bearer.

In an attempt to prove the value of the automobile in carrying dispatches between army posts, John Holm and William Walls, two crack drivers of the Studebaker Automobile Co., started from New York City, Tuesday, 18th inst., bound for Fort Leavenworth, Kan. They will visit all the army posts between this city and Fort Leavenworth, carrying a letter from Major-General Frederick Dent Grant, stationed at Governor's Island, N. Y., which is to be "vised" at each post. A 30 horsepower Studebaker runabout is being used for the purpose. Holm and Walls propose to follow the same route as that taken by the New York-Paris "racers," including the cities of Albany, Utica, Syracuse, Rochester, Buffalo, Erie, Cleveland, Toledo, South Bend, and Chicago, to Kansas City and Fort Leavenworth.

A NEW YORK-PARIS "RACER" QUITS

Covered 96 Miles in Six Days—Another "Racer" Towed by Horses—Snow Shoveling Still Continues.

Approximately one-twenty-fifth of the distance the cars competing in the overland trip from New York to Paris will have to cover if they get there, has been traversed by the leading car—the only American car in the so-called "race." Montague Roberts, driving the Thomas car, reached Toledo at 9.35 p. m. Tuesday, having covered 785 miles. At that time the DeDion car, in charge of Bourcier St. Chaffray, had reached Fremont, 756 miles, the Zust, driven by Sirtori, arriving at Cleveland, 667 miles, at the same time the De Dion pulled into Fremont for dinner. The Prothos, with Ernst Maas at the wheel, was then at Erie, Pa., 556 miles, and the heavy Motobloc, in charge of Charles Godard, had gotten to Buffalo, a distance of 471 miles. The Sizaire-Naudin, the other contestant which started from New York on Wednesday last, 19th inst., is out of the contest. It succeeded in reaching Red Hook, N. Y., 96 miles from the start. If they reach Paris the remaining cars will have covered about 20,000 miles.

That all the cars have been having trouble there is no doubt and also that the contest has developed into a snow-shoveling match, as the Motor World predicted, there is no contradiction. Heavy snow storms were encountered through New York State, and as a result all the cars were much behind schedule.

On the second day out from New York only two of the cars reached Fonda, N. Y., before nightfall. They were the Thomas and the Zust, the De Dion stopping at Amsterdam, 186 miles, while the Prothos and Motobloc got as far as Albany and Hudson, respectively The poor little one-lunger—the Sizaire-Naudin—was laid up at Montrose, 40 miles, with a broken differential.

Friday, the 14th, saw three of the cars reach Canastota, N. Y., 275 miles, within a few minutes of each other. The Prothos got as far as Utica, 148 miles, and the Motobloc remained in Albany all night. The Sizaire-Naudin, which had been repaired, made four miles that day, stopping at Peekskill. The three leaders—the Thomas, Zust and De Dion—took turns at leading during the following day and rolled into Geneva, 352 miles, together before supper time. Both the Motobloc and the Nandin experienced mechanical troubles.

Naturally there was a great demonstration when the Thomas reached Buffalo, its home town, in front of the others Sunday, 16th inst. An escorting party of Buffalo automobilists met Roberts several miles from the city, and all speed limits were forgotten in the run to the center of Buffalo. The Thomas reached that city two hours in advance of the De Dion, while the Zust was laid up some hours at Rochester with a disabled gear. The Prothos and Motobloc were some distance behind, while the little Naudin, was put out for good at Red Hook, N. Y., 96 miles from New York City. An amusing incident happened at Buffalo, which shows that the Frenchmen mean business, and will not forget it for a moment even to enjoy a good meal.

E. R. Thomas had planned to give the competitors a banquet and it was so arranged. St. Chaffrey, the generalissimo of the run, suddenly slipped away unknown to the others and was on the road to Erie, Pa., before Roberts, who in the meantime had sent his car to the factory to be overhauled, heard of it. There was nothing to do but to follow, and the Thomas was hastily gotten into commission, and Roberts started in pursuit. The wily Frenchman was overtaken at Erie, where he stopped to spend the night. The crew of the Zust car, although hampered by lots of tire trouble, resolutely kept going and reached Ripley, 543 miles, before darkness set in.

That the Italians mean to take no rest until they overhaul the leading Thomas and De Dion cars was evidenced on Tuesday They reached Cleveland at 7 o'clock that night, and although fagged out, started moving again at 1 o'clock Wednesday morning.

Roberts does not mean to continue with the Thomas car all the way to Paris, as evidenced by the fact that he is entered in the Briarcliff trophy race as well as the Grand Prix to be held in France during July. When Roberts and Schuster, the alternate driver, quit, the car will be turned over to William Brown, to continue on the trip to Paris.

Just what has become of the independent car which started from New York City, one day before the main division in an attempt to beat the sextette to Paris, not even the New York newspaper which projected the American end of the adventure, seems to know. As recounted in last week's Motor World, the car had to be towed a great part of the way to Philadelphia—it is taking a different route—and after spending two or three days in the Quaker City the three adventurers got into a dispute among themselves and Driege and Hohman, left the city without Le Louvier, who claims to be the originator of the New York-Paris idea, and who, becoming piqued when the Paris newspaper promoting the affair refused to follow his suggestions, decided to organize a race of his own. According to Philadelphia advices not one of the three men knows as much about driving a car as the majority of garage office boys, and the result has been disastrous. The car has been lost sight of completely.

Reports received in this city last night show that the leading cars have run into a severe snowstorm and are making slow progress. Roberts succeeded in pushing his Thomas on to Kendallville, Ind., 891 miles. The Thomas got stuck in a snowdrift two miles from Kendallville and it was nearly midnight, Wednesday, before a party of farmers cleared a path for it to proceed. As it is leading naturally the Thomas car is having a harder time of it than is the De Dion, following closely behind. The leading car breaks the snowdrifts, so that it is much easier for the car behind. In view of this it is not surprising that while the Thomas car yesterday only covered 110 miles, the DeDion made 22 miles more. However, the De Dion ran into a big drift while turning off the main road in Corunna, and—alas and lackaday!—had to be towed into town by horses. In "races" of this sort, however, towing or anything else is allowable. It remained in Corunna over night. The Italian Zust succeeded in reaching Bryan, Ohio, 854 miles, last night, having made a remarkable run of 187 miles through the snow in its efforts to overtake the leaders. The Prothos was last heard from in Ashtabula, Ohio, but Cleveland reports state that it cannot be located, and is believed to be snowbound some miles from that city. The Motobloc, the tail-ender, now that the Naudin has withdrawn, is also stuck in a snowdrift about 20 miles from Erie, Pa., and Godard and his crew are taking advantage of their plight to secure a few hours' sleep.

If the present storm does not abate the crews will doubtless be compelled to shovel their way into Chicago yard by yard. A. J. Banta and Paul Picard left Chicago several days ago to meet the snow shovelers, and Picard returned to Chicago last night. He said that in all his experience he never hac seen conditions so terrible. Trees and fences are hidden under snow. Banta is completely snowed under, but refuses to go back. In 48 hours he has covered only five miles.

Odd Wail that Comes from China.

That the universal adoption of the motor vehicle for business and pleasure must ultimately work havoc with the Chinese cutlery trade, is the astonishing conclusion which must follow any contemplated shelving of the horse in favor of the more modern auxiliary of transportation. One of the constantly growing imports into the province of Shantung, China, is scrap iron consisting largely of old horseshoes. So great is the demand for this material that a recent single shipment of 300 tons was not considered at all extraordinary. The knife and tool makers all over the province use the metal in making their wares, claiming that it has a peculiar temper due to the constant beating it receives under the horses' feet, which it is impossible to obtain in any other way.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

"76 GASOLENE" A DELUSION

Why the Baume Test Fails to Indicate Fuel Value—Evolution of the Processes of Production.

If the average motorist were to be told that "76 gasolene," which he has been taught to believe is the proper fuel for his engine, is no better than 60 or 80 gasolene, he would receive a distinct shock. If he were to be told further, that the ordinary specific gravity test, which has been held up as the proper basis of judgment for a number of years, has practically nothing to do with the essential properties of the fuel, as such, he would probably turn away in scorn. That such is the case under existing conditions, merely goes to show how far behind the times popular ideas may stray when based on custom and precedent.

It is by no means a novel suggestion that the gasolene produced for automobile consumption is far from the simple substance which its name implies it to be. Originally a plain fractional distillate from crude oil, employed to a limited extent in enriching the coal and water gas used for household illuminating purposes, the growth of the automobile industry has so influenced the market as to render it practically impossible to produce a simple oil answering to the requirements which have been built up under that inclusive name. What was one time largely a by-product and often thrown away, now has become an important staple in the market for the manifold petroleum derivitives. Incidentally, the status of the "naptha" or gasolene of commerce, has been changed to a remarkable extent, and in the course of the transformation, while its efficiency as a motor fuel has in no way been diminished, its composition, chemically and physically has undergone sufficient alteration to completely nullify the value of the specific gravity test.

It should be observed, that even before this change had become sufficiently marked to render the former standard of comparison of no avail, much confusion had been wrought by the common misunderstanding as to the relation between specific gravity, and the reading of the hydrometer by means of which it commonly is measured. Unfortunately for the non-technical observer, the average hydrometer, or "specific gravity indicator," as such instruments are sometimes erroneously termed, is graduated to read in the Baume scale. As it happens, 70.0 Baume, is the indication coresponding to a specific gravity of 70.2 per cent. This is the basis of confusion of the terms. It would do little harm were it not for the fact that the two scales "cross" at about this point, higher specific gravities being indicated by lower Baume readings.

In this way, the 76 gasolene of commerce would be of 68 per cent. specific gravity—were this indication always a reliable one. As will be shown presently, however, the so-called "76" does not always answer to the 76 test, whence much dissatisfaction and many complaints have arisen. That many of these complaints have not been well founded, also will appear presently. The accompanying table serves to illustrate the comparison between Baume and specific gravity, and is made to include the range about which so much misguided contention has hinged:

Baume	Specific Gravity.	Baume	Specific Gravity.	Baume	Specific Gravity.	Baume	Specific Gravity.
60.0	.739	65.0	.720	70.0	.702	75.0	.685
61.0	.735	66.0	.717	71.0	.699	76.0	.682
62.0	.731	67.0	.713	72.0	.695	77.0	.679
63.0	.728	68.0	.709	73.0	.692	78.0	.675
64.0	.724	69.0	.706	74.0	.689	79.0	.672

In order to understand how the specific gravity or Baume test has come to lose its value as a measure of the suitability of the fuel, it is necessary to go back into the history of gasolene far enough to trace the increasing demand for it and the way in which that demand has affected its production. Originally, the naptha or benzine from which gasolene is made, was largely a by-product of the process of refining crude oil, or petroleum. In the early history of the oil industry, there was practically no market for naptha, and the bulk of that produced was allowed to go to waste, either deliberately or through lack of economy in the manufacturing processes. Eventually markets were created until it ceased to be a total loss, though it was by no means regarded as an important member of the crude oil family.

Its early general uses were chiefly confined to such manufacturing purposes as those involving the extraction of oils from vegetable or animal matter, the mixing of paint, and the solution of varnish gums. Its most important service, however, was performed in its application to the production of illuminating gas, where it ultimately eliminated the use of the expensive Cannel coal, substituting a domestic for an imported element in the raw material used. Yet even within the present decade, these uses had not begun to absorb all the naptha produced, and large quantities of it were burned under boilers, in order to get rid of the surplus without actually wasting it.

Then came the development of the internal combustion motor, using first gas, and then gasolene, as it had come to be known. For the purposes of motor fuel, it was found that a grade of gasolene which answered to the 76 test served to best advantage, and accordingly that basis was accepted as the standard by motorists and dealers, in a purely arbitrary manner. Soon, however, the rapidly growing use of internal combustion engines, chiefly in connection with the pursuit of motoring, began to create a demand for the standard fuel, greater that the supply. The by-product had commenced to assume important proportions in the market.

So in time, the Pennsylvania oil fields, which had been the chief basis of former supply, were exhausted, and other localities were drawn upon to a greater extent than before. To-day, despite the fact that the United States is the greatest oil-producing country in the world, great quantities of naptha are imported from other localities, such as Sumatra and Borneo, in order to swell the volume of the product which even under these conditions threatens to become insufficient to supply the constantly growing requirement.

Just here one of the many peculiarities of the petroleum distillates requires especial emphasis. Though the crude oils themselves closely resemble one another, their chemical composition varies exceedingly. This variability is carried through all the products to a certain extent, so that in the case of the napthas a great amount of difference is observable. It may be supposed that the processes by which the product is obtained are largely the same in all cases, and that were it not for this basic difference in the crude oils, the resulting fractions would be precisely alike in all respects. As it is they vary to such an extent that in their original state they reveal strikingly different properties.

Consequently the production of motor fuel requires a judicious blending of different products in order to secure the volatil and thermal properties which govern its usefulness. In the blending process, specific gravity is entirely ignored. It is the object of the producer to develop a fuel which will evolve a maximum ignition pressure when burned with 85 per cent. of air, and which will flash at temperatures within certain closely defined limits. As a matter of fact, the gasolene in current use is found to vary anywhere from 76 to 60 Baume, which corresponds to a range of from 68.2 to 73.9 per cent. specific gravity. There is also a certain wide variation in the boiling point, which may vary from 120 to 330 degrees Fahrenheit.

It is on this account that the specific gravity test is of practically no value in determining the quality of the fuel. The so-called "Motor Spirit" which may be bought in the open market is intended solely for motor use. That is to say, it is produced with regard to the thermal and evaporative qualities, which govern at once the relative amount of power derivable from it, and the facility with which it may be carburetted and delivered to the cylinder in combustible form. Other gasolenes and napthas, such as are produced with specific regard to the demands of the sundry manufacturing purposes for which they are employed, are produced under similar conditions and their properties from the motorists' point of view must be regarded with more or less suspician.

It is well known that the gas engine will run under certain conditions on almost any

Digitized by Google

fuel ranging from crude oil to absolute alcohol. But the most satisfactory supply from the general utilitarian point of view is the specialized product which is offered for the purpose and which, like his tires and his lubricants, the motorist must take at face value, without inquiring or needing to inquire into the chemistry back of them, or their own physical properties. The usefulness of the hydrometer in this connection has entirely passed.

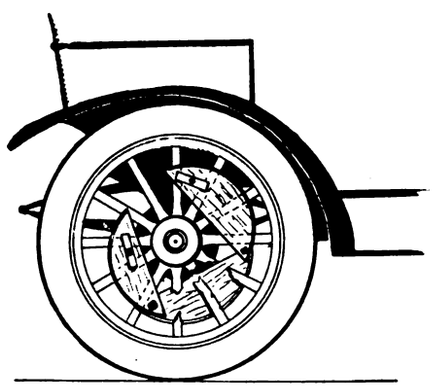
Improved Top for Runabouts.

While the runabout with the double rumble seat has attained a degree of popularity with those who find in this type of car the desirable features of a compact, companionable turnout which may be readily converted into a more imposing vehicle, with accommodations for four persons, there has been difficulty encountered in obtaining a satisfactory top. The principal objection to be overcome lay in the necessity of having something constructed in such a manner that the bows should not interfere with the access to the rumble.

The Rands Manufacturing Co., of Detroit, have solved the difficulty by so arranging the bows that they do not cross the entrance to the rear seats of the car, either when the top is up or when it is folded back in a compact space. The top is attractive in appearance and though light is still very strong and can be readily made rigid when in use.

Street Refuse on the Air Screen.

An annoying condition, which occasionally occurs, in engines equipped with a carburetter having a self contained gasolene and air screen, is first made apparent by the engine running at irregular speeds. For a few yards or may be a block or two the power plant will be giving its full energy, then the engine slows down to almost a standstill and as suddenly will resume its normal revolutions. When this occurs the screen, if removed, will probably show an accumulation of street refuse which has been sucked in through the air intake and packed on the screen, preventing a proper quantity of air from passing evenly into the carburetter. Remove the dirt and no further trouble will be encountered.



Temporary Repair of Cut Tire Casing.

When a tire suddenly collapses and the shoe is removed to discover the reason for it, there may be found on the inside of the casing a cut which has gone well into the fabric without appearing on the outside of the tire. This may have been caused by an improperly protected lug—one from which the leather covering has come off—having made the cut when the tire was run on while flat. Cover the incision with a piece of leather and no further trouble will be experienced for a time, but unless a replacement is made at the earliest opportunity the tube will again be pinched as the leather will "travel."

BARREL HEADS AND HEAD WORK

Combination that put a Crippled Wheel in Splints—How Some Chauffeurs Can Meet Emergencies.

"I wonder what one of these liveried automobile attendants, whom we frequently see driving cars, would do if his car should skid into the curb and crush in a rear wheel," remarked a man whose extensive automobile interests had offered the opportunity of getting acquainted with most of the conditions and experiences which may be encountered. "Or rather, I don't wonder, for I know; it would be a telephone call for a new wheel or a truck. When you're

CRIPPLED WHEEL IN SPLINTS

all togged out in a fine 'monkey' uniform you can't be expected to do much in the line of roadside repairs; and besides," he added, "the fellows who wear livery are not able, as a general thing, to do much more than drive a car. If they were they would not have to dress like coachmen.

"I saw a thing a few days ago that well illustrates the native ingenuity of some men," he continued. "It was on the outskirts of the city. In making a turn the machine, a runabout, skidded into the curb, and down went a rear wheel with four spokes broken. The chauffeur got out and took a look at the wreck, then calmly lighted his pipe, and I could see he was doing some real thinking while he made a careful examination of the damage. In a minute or two he straightened up, looked up and down the neighborhood, and then made a bee line for a store with a grocery sign above the door. In a few minutes he came back with an odd assortment of lumber under his arm, consisting of barrel heads and box covers, with which he proceeded to get his car into temporary shape for its trip to the garage.

"First jacking up the wheel he forced the rim back to as near its original shape as possible, then a half barrel head was placed on the outside of the wheel and two others like it were placed on the opposite side in such a position that the points of the two met and overlapped the one in the center, that is the pieces alternated, one on the outside of the wheel overlapped the one on the inside, which was in turn lapped by the third one. Bolts were forced through all these and when the nuts were tightened up the board in back, which covered the space where the broken spokes were, was drawn tight as possible toward the other two boards, which were against the good spokes, and the whole formed a pretty substantial brace which permitted of the car being driven home under its own power. It was one of the cleverest roadside repairs I've ever seen."

Started His Fire with Gasolene.

An incident, which fortunately was funny, though it might have been extremely serious, occurred during a recent cold spell in a private garage which has as an adjunct a well equipped repair shop in which a mechanic and a German helper are always busy caring for the seven cars which comprise the family's automobile equipment.

For reasons which no sane man can understand, the garage and shop were heated by stoves, and it was a part of the helper's duty to attend to the fires. One cold morning when he arrived he found the big stove cold and the fire out; he quickly prepared the paper and wood and, to get quick action, added a generous sprinkling of gasolene. Had he lighted it at once all would have been well, but he was called away, and about ten minutes later returned and applied the match. In an instant there was a roar, the top of the stove went up and the doors blew out, while a sheet of flame enveloped the stove and rose almost to the ceiling.

In some miraculous way the helper escaped without injury, and no damage was done, save to the stove, which was destroyed, and to the helper's nervous system, which received so severe a shock that it was depicted on his countenance and was further manifested by an outpouring of German invective which furnished what proved to be the humorous feature of a serious experiment.

Why Noises Should not be Ignored.

Though the noise made by the vibration of some unimportant part of the equipment—such as the glass of an oil light for instance—is annoying, it is often considered too trivial to be given immediate attention, and it is permitted to continue until an entirely convenient moment is at hand or until it is repaired for lack of something else to do while "killing time." Such a detail may be unimportant to the general running of the car, but the habit of letting things go until "to-morrow" is one easily formed and for a driver to accustom himself to unnecessary noises and to become so hardened to them that he doesn't "bother" to correct them, means that he is subjecting himself to a condition, and putting himself in a position where he will soon cease to give heed to warnings which portend more serious disarrangements with consequent expensive results.

SAMPLED ROADS OF ALL SORTS

Johnson's Circuitous Trip from New York to Savannah—Ten States Visited in True Touring Style.

One of the longest tours of recent years has just been successfully completed by R. H. Johnson, a member of the Touring Committee and of the Good Roads Committee of the American Automobile Association. Mr. Johnston drove his 30 horsepower White steamer from New York to Savannah, by a circuitous route, passing through ten states and covering a total distance of 2,044 miles. Mr. Johnston summarizes his trip as follows:

"We started from New York, not with the intention of doing any sensational stunt, but with the purpose of finding a good touring route between North and South, and to do what little we could to forward the good roads movement. We were not concerned with finding the shortest route, but our idea was rather to see as many places of interest as possible. We first proceeded to Philadelphia and from there to Harrisburg. Here we turned southward and passed through Gettysburg, climbed the Blue Ridge, and continued on to Hagerstown, Maryland. Here we again turned westward and journeyed to Cumberland where commences the old National highway. We followed this one road a total distance of 320 miles, first over the Allegheny Mountains, where we had many climbs of one, two and three miles, then through Wheeling, W. Va., and Columbus, Ohio, to Springfield. Here we turned southward through Dayton to Cincinnati. Then we had a delightful 300 mile trip through Kentucky, where we found many more miles of good roads than we had anticipated. We visited Lexington, the center of the famous blue grass, horse raising section; Frankfort, the picturesque capital of the State, and Louisville. At Frankfort we met William J. Bryan, who rode with us for a short distance and who expressed his sympathy with the good roads movement.

"South of Louisville the roads were rather rough, but the going was not particularly severe, except on the 25 mile detour we made from the main route in order to visit the Mammoth Cave. The next large city which we visited was Nashville, Tenn., and then we were agreeably surprised to find a toll road from that city to the Alabama line, 100 miles to the south. We continued due south until we reached Huntsville, Ala., where we turned east. Thereafter, we had some very bad mud, due to the abnormally heavy rainfall, but we kept going and reached Chattanooga in good season, crossing the Tennessee River on a flat-bottomed ferryboat, propelled by two oars.

"We next climbed Lookout Mountain, visited Missionary Ridge and the battlefield of Chickamauga, where there is a most imposing array of monuments, some for the Blue and some for the Gray. From Chattanooga we proceeded almost due south through Rome, Cartersville, and Marietta, to Atlanta, and from there to Macon.

"The trip from Macon to Savannah was by far the hardest portion of the journey. The roads are hardly more than trails through the sand, which becomes heavier as one nears the coast. But the principal reason why few automobiles ever attempt this trip, even at a more propitious time of the year, is because almost all of the streams are without bridges. Even those streams which have bridges, must be approached through water, as the bridges are built only over the deepest parts. As we made the trip after a season of heavy rain, it can be imagined that we had to do some rather sensational fording. Often the water washed over our big 36-inch wheels. Several times our burner was extinguished. But this did not bother us, as we always had a reserve supply of steam in our generator sufficient to carry us to terra firma. We were almost three days in making the 200 miles between Macon and Savannah, which was by far the slowest progress we made on any part of the tour.

"Our total elapsed time from New York to Savannah was three weeks and five days. It should be noted that we were not out for records, but took time to see all the places of interest in or near our route. As is evidenced by our continuous progress, we had no trouble with the car, and our tire troubles, despite the severe character of much of the road, were almost negligible.

"I think I may safely say that during the trip we had every known kind of weather, ranging from the blizzard we experienced in the mountains near Uniontown, Pa., where we could hardly see the road a yard ahead of us, to the delightful sunshine of Georgia, where we discarded coats, gloves and even hats. Furthermore, if there is any kind of road which we did not find during our 2,044 mile journey, that kind must be something better than the magnificent government road which runs along Missionary Ridge. I do not believe that anything can be worse than the occasional patches of quicksand in southern Georgia, the black bottomless mud of Jackson county, Ala., or the grades of stratafied rock leading to the Mammoth Cave."

Paris Horse Census Shows Decline.

An indication of progress, which doubtless will be eagerly grasped by the prophets of a "horseless age" is that revealed by the falling off in number of horses used in Paris. In the last ten years this has amounted to exactly 10 per cent. In 1897 the equine census revealed a total of exactly 92,026 head of horses, while the corresponding figure for 1907 was only 83,458. In the 8th "arrondissement," the Champs Elysees, the drop amounts to 50 per cent.

NOT REALLY BIRDS OF A FEATHER

But the Chauffeur Who Tried to "Flock" with the Millionaire Didn't Know—Where Extremes Met.

The cold wind "howled dismally" around the vicinity of Forty-second street and Broadway. It also "howled dismally" elsewhere. The cold wind usually "howls dismally" or "bitterly" in Ouidian novels.

In front of the $1,000,000 lobster palace stood two cars. One was a $10,000 car with a $5,000 body. The other was a $2,000 car with a $346.98 body. In front of the $10,000 car with the $5,000 body stood a young $1,000,000,000-aire. He felt that life had its compensations, after all, for he had just eaten a $1,000 dinner, with $50-per-bottle wine as a side drink. An $8,000 fur coat, $300 fur cap and $250 fur gloves protected him from the cold winds that "howled dismally." Ever and anon he removed the $100 perfecto from his lips to insert a 24-karat gold toothpick, lest a visage of the $1,000 dinner should remain. He was waiting for Mrs. $1,000,000,000-aire, who had stopped to speak to some friends.

In front of the $2,000 car with the $346.98 body, stood a very ordinary chauffeur, in a "goat fur" coat, and a 98-cent cap purchased from a cut-rate bargain store in the locality. His gloves were not fur, and he stamped his feet and swung his arms vigorously in a vain effort to induce circulation. He was only a poor chauffeur, and had not had anything heavier that coffee and rolls since morning; it was now nearly 4 o'clock. He waited for his employer who was within the $1,000,000 lobster palace.

Finally the Very Ordinary Chauffeur walked over to the Befurred One, and said:

"Say, Bo, you must be in soft. Whose car 'ye drivin', anyway?"

Thus is it made plain that men are not always what they seem; also is it illustrated how pride may be humbled.

Automobile Rule Applied to Camels.

In America it is the automobile which the authorities insist shall travel only at a moderate speed, besides being provided with light and sound producing appliances, but on the sunbaked promontory of Aden the corybantic camel has come in for speed restriction. According to report an order has been issued in Aden that "all camels going beyond a walking pace after sunset must be provided with a bell." Those who have never beheld the camel when his foot is on his native heath, or rather sand, can hardly grasp the idea of the unwieldly Bactrian being induced by any conceivable means to get up a speed faster than that of a ponderous Broadway "cop." The real reason, however, is that the animal's feet are so big, soft and clumsy that they make practically no noise.

POWER WASTE IN CYLINDER WALLS

Its Proportion to the Amount Developed Charted from Tests—How the Results were Reached.

It is quite generally understood that of the total power developed by the burning gas within the cylinder a large proportion goes to waste, the principal sources of loss being the exhaust and the cooling water, or, in the case of the air-cooled motor, the air immediately surrounding the radiating flanges on the cylinder. In fact, it is unquestionable that in many instances, the amount of loss localized in the cylinder walls even exceeds that from any other source, nearly half the power developed actually being wasted in heating the jacket water in some instances of poor design, while frequently more power is lost in this way than is converted into work.

The relation between power developed and power lost is in no way better illustrated, than by means of a graphic table, like the accompanying, which shows at once the power developed at the fly wheel throughout the speed range of the motor, the power lost through the cylinder walls, and the thermal efficiency of the motor. The third curve, represents a concise summary of the results expressed by the other two. The upper of the two first-mentioned curves showing the loss through the jackets in terms of horsepower, as compared with the second—the power developed at the fly wheel—makes an impressive showing.

The diagram is based on a series of tests conducted by White & Poppe, Ltd., Coventry, England, upon one of their own four cylinder vertical engines, measuring 100 by 110 mm. The curves, and the following outline of the method of test, as published in the Autocar, show that the results are closely checked, and authentic. The actual efficiency under the various conditions of speed and load shown by the test, of course appertains only to this engine, the object of the trials being merely to establish in a general way, the relation between power developed and power lost through the walls. This factor, however, may be taken as fairly representative of the results obtained ordinarily in current practice.

"The engine was mounted on a test stand and fitted with air braking vanes, so that when the engine was run at a certain speed the horsepower was definitely known without calculation," says the authority quoted. "The accuracy of this method of testing was in the first place determined by an electrical checking method, so that any error could not come into the observations. Water was circulated through the jacket of the engine, and the amount passed through in a given time was carefully measured. A thermometer placed at the inlet and outlet pipes to the water jackets indicated the initial and final temperature of the cooling water. The rise in temperature, taken in conjunction with the amount of water passed through in a given time, gave the means of calculating the work lost or absorbed in the cooling water.

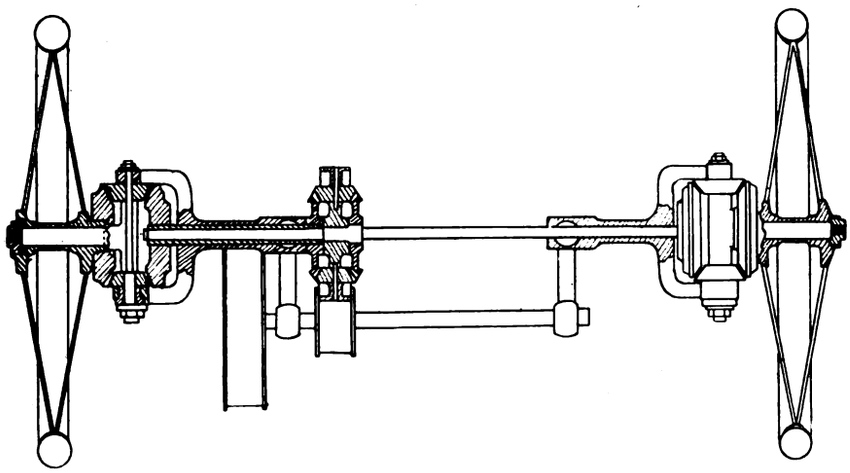
"Tests were made of the engine running light when electrically driven to ascertain the frictional resistance of the engine itself. The losses in the exhaust gases were not directly taken, but calculated after the brake-horsepower and the cooling water power absorbed had been determined. The difference, of course, is due to engine friction, radiated heat, and exhaust gas losses.

"The petrol employed had a density of .72, and through the experiments the approximate petrol consumption was .72 pint of petrol per horsepower per hour. The heat value of the 'petrol' was practically 11,000 per kilogram, and one calorie was taken as 424 kilogram-metres. Calculation showed the theoretical horsepower to be 5.1 horsepower for each useful horsepower developed. The efficiency, therefore, of the engine was 1/5.1, or practically 19.6 per cent. . . . .

"The normal engine speed of this particular type of engine was 1,360, and at this speed it will be noticed that the brake horsepower curve indicates about 32½ horsepower, whilst the horsepower lost in the water is no less than 44 horsepower. As a matter of fact, if the whole of the fuel employed was turned into useful work, assuming very small engine friction, and that nothing was lost in the cooling water and the exhaust gases, the actual horsepower developed by the fuel consumed at a speed of 1,360 crankshaft revolutions would be something over 160 horsepower. . . . .

"The lowest of the three curves gives the percentage of the fuel converted into horsepower. It will be noticed that as the speed increases the percentage of fuel converted into horsepower decreases, and this might only be expected, because as the speed of the engine increases the compression becomes slightly lower, owing to the fact that the cylinder is not completely filled at each stroke."

Systematic Inspection of the Car.



While a general inspection of the entire car at frequent intervals is always advisable, it is well also to make a systematic investigation with a definite purpose in mind. For instance, look at every nut on the car to see if those which should be protected from coming off by a cotter pin always have this little detail and where it has fallen off, or been neglected, supply the deficiency. And again, look for loose nuts and have a wrench in hand to try each of them. In making these specific searches one will notice other things which are to be corrected, while a general investigation may often fail to discover the disarrangement of minute details which, though small, are of great importance.

AXLE PROBLEM IN FRONT DRIVE

Some of the Solutions and Wherein They Fail—Application of the "Jack-in-the-Box" Idea.

However satisfactory the principle of driving and controlling the vehicle by means of the front wheels may be in theory, the fact remains that in practice it is very difficult of achievement—at least according to present notions of structural requirement and possibility. In such electric systems as permit the mounting of the motor directly in the wheels, or in the scheme of the "gasolene wheel," which was developed experimentally several years ago, the problem is rendered comparatively simple. Where the motor is located in the chassis so that it is necessary in addition to transmitting the power to the driving wheels and making some provision for differential motion between them on turns, to allow for the deflection of the wheels without interfering with the driving function, the maximum complication of requirements exists.

The most natural way of attacking the problem from the standpoint of present design, is to construct the axle practically as though it were the ordinary live rear member, except that the wheels are mounted on steering knuckles, and the driving shafts are connected to them through universal joints. Several objections to this method arise, however, notably owing to the variable velocity and resistance of the universal joint when operating under conditions of wheel deflection. A part of this objection may be overcome by doubling the joints in each of the individual driving shafts, but this involves the objection of adding to the mechanism, introducing also, lost motion, friction and liability of breakdown in the ratio of two to one, theoretically at least.

A more obvious method, and one which from the theoretical point of view is far more desirable since it permits the deflection of the steering wheels to take place without affecting the driving function of the axle, is applied in one of the pioneer inventions of this class, that of Messrs. Lacoste and Duncan, which was granted an English patent as long ago as 1896. It consists merely in the manifold application of the principle of the common bevel gear differential or "jack-in-the-box," as it is sometimes familiarly known. The differential balance gear is mounted in the driving shaft as usual, while at either end of the axle is mounted a second differential group in which the usual "floating member" carrying its two bevel pinions, is made the steering pivot, while one of the two larger bevel gears is affixed to the end of the driving shaft and the other mounted on the wheel. The accompanying illustration shows the arrangement in somewhat idealized form.

The driving force is transmitted to the wheel through the intermediary of the pinions, which incidentally reverse the direction of motion, thus necessitating the backward rotation of the driving shaft for forward motion of the vehicle. The extreme nicety of the arrangement, however, exists in the provision which it makes for independence of the steering movements of the wheels. Supposing the vehicle to be stationary for the moment, it is evident that as the wheels are swung from one "lock" to the other, they must roll about the pivots, even though cambred in such a way that their points of contact with the ground are central and stationary under these conditions. In the arrangement under consideration, the wheels are set perfectly vertical so that in swinging into or out of lock they roll. The driving gear, however, is not affected by these movements. If it makes no difference which way the wheels are swung when the driving gear is at rest, naturally, it does not affect the driving function if they are swung when the vehicle as a whole is in motion, so that the complete disassociation of the two purposes is accomplished.

Judged on the basis of present driving systems, this arrangement is obviously crude and over complicated. Regarded as a study in design, however, it is highly interesting and suggestive. Several other methods of front driving and steering were contemporaneous with this arrangement, notably that covered by the Sydenham patent of the same year. For the most part they were too crude to be considered at all seriously now, however. An example of this early development which was extremely simple, but equally impractical from the present point of view, was that of employing a swinging front axle of the live type, carrying a differential balance gear the motion of which was controlled by a pair of brakes. Applying one of the brakes, retarded the wheel to which its side of the differential was connected, correspondingly advancing the other, and so swinging the axle. It is not surprising to learn that this system was not sufficiently "sensitive" to permit of continued use, or that other drawbacks arose which served to discontinue its use. Considered in the broadest possible way it appears that front actuation and control is sufficiently desirable to warrant a general renewal of attention. This is particularly true in the case of the commercial vehicle.

Special Ammeter for Testing Coils.

Attention directed to the fact that with the ordinary type of multiple vibrator spark coil, it is practically impossible to obtain absolute synchronism in the ignition by the ordinary methods of adjustment in which the eye and ear alone are employed in judging the quality of the spark, has brought out that the Connecticut Telephone and Electric Co., Meriden, Conn., are marketing a special, low-reading ammeter, termed a coil current indicator, which is made for exactly this purpose. It may be connected to any of their coils by simply "plugging-in" to one of their regular switching jacks, and gives a close registration of the consumption, thus furnishing an ideal check on the adjustment. The use of a special ammeter constructed for the purpose, is particularly helpful in this connection, as was pointed out, since by testing the current in the primary circuit it is possible to determine the exact consumption of the coils for various adjustments of the vibrator.

Water Cooled Crank Case and Gearset.

Water cooling for the crank case of the motor and the transmission gearset, has not been heard of hitherto, nor would it generally be thought necessary. A system designed to effect this, has recently been devised and patented, however, by the Daimler Moteren Gesellschaft, fountain head of all the Daimler and Mercedes products. The water is circulated first through the jacket surrounding the gearset, then around the motor crank case, and then through the cylinder jackets, after which it passes through the radiator before returning to its original path. The object is to prevent any rise in temperature due to possible excess of friction; and also to preserve a uniform temperature under all possible conditions.

EFFECTS OF COMPROMISE ON DESIGN

How the Practical Medium Between Extremes is Developed—Examples in the Evolution of the Automobile.

While the evil of going to extremes is equally apparent in all things, it is nowhere better emphasized than in the realm of mechanical engineering, the principles of which closely hedge round what is broadly known as "practice." Still it is rather an unusual notion that in consequence of this, practice is nothing more nor less than an array of compromises, sanctioned by usage and common consent. In this connection a foreign authority points out a number of instances illustrative of the way in which just this effect is produced by the conditions limiting the designer of the motor car.

"It is doubtful if even the designer himself thoroughly realizes the important part which 'compromise' plays in his designs and of the many others interested in automobilism few probably have given the matter much thought," he remarks. "Let me make my meaning clear, and I shall be able to do this more easily by selecting some 'detail' for discussion. A connecting rod comes to my mind as being, perhaps, as good as any.

"How does compromise affect this particular part? Suppose we imagine a rod of extreme length coupling the piston to the crank pin. We should in this case get practically no side thrust at all on the piston, for the rod would at all positions of the revolution of the crank occupy a position nearly parallel to the axis of the cylinder, and from this point of view such a rod would be ideal. It is easy to see objection, however, to such an arrangement. The rod would be excessively heavy, the overall length of an engine so fitted would be great, and expense of production would be proportionate. On the other hand, we might employ an exceedingly short rod, or, say, one equal to about the length of stroke of the piston; hence we should get enormous side thrust, and consequently wear and tear, on the piston and cylinder walls. Such a rod would, however, be light, and therefore suitable for an engine having a high speed of revolution.

"Hence we observe that it is necessary to compromise between the two extremes and steam engine practice in this case, many years before the introduction of the petrol motor has decided this 'happy medium' for us. . . . .

"Let us take another case and discuss it in the same fashion, and this time we shall select a part where the points to be considered are more numerous. A rear road wheel fulfills these conditions well. In the automobile of ten years ago it was customary to use considerably larger wheels than is the case at the present day, obviously owing to the use of them on horse-drawn vehicles. Various objections to large wheel diameters, however, present themselves to us. Firstly, it is not easy to reduce the speed from the engine to the road wheels to a sufficient degree without entailing big frictional losses in the process; secondly, the cost of a pneumatic tire of such a size would be great; thirdly, it is more difficult to build a large diameter wheel of sufficient strength for automobile purposes; and, fourthly, a large wheel practically necessitates a high, and therefore unstable, car. It appears that we can only put one advantage against these four objections. This advantage is, however, a considerable one—a large wheel conduces to very easy riding and reduces road shocks. We should, perhaps, add that a tire fitted to such a wheel would last longer, on account of its fewer number of revolutions per mile.

"Taking the case of the very small road wheel, we shall find that a small wheel increases the traction force necessary, especially over rough roads; that it puts more work on to the springs, and that it necessitates various parts of the chassis approaching perilously close to the road. On the other hand, the small wheel is cheaper to build, and its tire is cheaper than that of the large wheel. Fortunately for the tire manufacturer, the problem of wheel diameter has been boiled down to one or two sizes, but this boiling down process amounts to a system of compromise. . . . .

"There is, indeed, hardly a part of the modern motor car which has not at some time or another been subjected to this compromising process. Experience proves a part too light, we strengthen it; too short, we lengthen it; and so we proceed till eventually we arrive at a correct size and strength, which, forgetting the system of change which has brought us to it, we are apt to regard hereafter as fixed and unalterable."

Best Method in Tightening Chains.

It is a common practice to "jack up" the car when chains are to be tightened, and while this permits of the wheel being turned so that the chain may be "felt" in all positions of the sprockets, it bears little or no relation to the condition in which the chain will be when the car is again resting on the ground. The only safe and sure way to make chain adjustments is to do it with the car standing in its normal position and after tightening or loosening the strut rods push the car about the floor, constantly lifting or trying the chain, so that "high spots" in the sprockets may be provided for. In this way there is little danger of getting a chain too tight, which condition is far more serious than having it too loose, as the strain on the jack-shaft will result in worn bearings, if not the more serious mishap of springing the jack-shaft. Care may kill a cat, but extreme care makes just the difference in an automobile that lies between big upkeep expense and necessary outlay.

WHERE THREE WHEELS SERVE BEST

An Observer's Views on Transportation Conditions in Egypt—Advantages of Single Wheel Drive.

Whatever may be the characteristics of the motor vehicle as finally developed from its present tentative condition, it is plain to see that no absolutely fixed standards of construction can be applied to it in all of its possible applications. Special uses require special adaptations, and it will not be surprising if the business and pleasure cars of the future exhibit far greater structural differences than is the case to-day. In this connection the observations of a student of transportation conditions in Egypt are of interest, because it is his judgment, based on a number of years of direct experiment, that for use in the desert and in countries where practically no roads exist, the three-wheeled tractor, and the two-wheeled trailer are the most acceptable vehicles for motor haulage. In explanation of this apparently wild conclusion he gives the following arguments in favor of three-wheeled traction under the conditions here noted:

"1. With three wheels there is a three-point suspension on the road.

"2. The power being applied to the rear wheel in the middle of the frame, gives a direct application of power along the center line of traction, and all energy is directed along that line.

"3. The weight on the driving wheel can be easily regulated to give the requisite amount of road adhesion according to nature and surface of track.

"4. There is no complication of differential gearing, as is required when conveying the drive through the two rear wheels of an ordinary car, and none of the attendant strains of driving first on one side wheel and then on the other, according to the nature of the track.

"5. The simplicity of gearing between the engine and the driving wheel.

"6. The single wheel drive enables a driver to select the hardest part of the track for his road or driving wheel.

"In place of four-wheeled trailers and the consequent limit of wheel diameter for steering lock on short turns a two-wheel trailer with long platform and large diameter wheels is found to be more suitable for negotiating either soft or rough ground, and this type of carriage manoeuvres much more easily on awkward bends. The two-wheel cart for heavy transport is no new idea," he concludes, "and is in regular use in Southern Europe, giving every satisfaction on heavy draft work with horses."

JONES PRODUCES A TAXIMETER

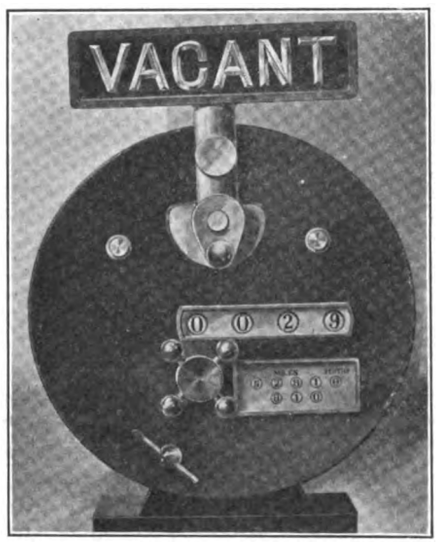
First American Fare Recorder Has Special Features—Variety of Records and Safety Against Tampering.

While this country has not been slow in adopting the taximeter vehicle, practically all of the "fare recorders" employed have been importations, as no American inventor who has been actively interested in producing the indicator has offered his device for general use. But the matter has been receiving careful attention from at least one American and Joseph W. Jones, whose speedometer is so well known, now has placed on the market an instrument to be known as the Jones taximeter.

This latest addition to the Jones line is an instrument about 7 inches in diameter by 4 inches thick. The dial face is of silver with figures indicating the rate or tariff, the total fare to be paid by the passenger and a separate indicator for extras. On the reverse side is another dial on which is indicated the total sum paid to the driver, the total mileage and a trip mileage, which latter can be reset by the operator at any time. There is also a record of the number of trips with single and double tariff.

The meter is arranged to display a "Vacant" sign which is thrown to the right, into a horizontal position when it indicates on the dial tariff (1) and at the time indicating an initial charge of 30 cents for the first half mile, when a passenger enters the vehicle. After this distance has been traveled an additional charge of 10 cents for each quarter mile is added to the total. Trunks and other baggage for which a charge is made, are recorded by turning a knob which controls the "Extras" dial, and adds the sum recorded to the "Total Fares."

The meter is constructed so that if the "Vacant" sign is thrown to the left until a horizontal position is obtained, the same initial charge is recorded, after which there is an additional charge of 10 cents for each one-sixth of a mile, in this way covering the cost of 4 or more passengers.



The taximeter contains also clock mechanism which, when the "vacant" sign is down and the vehicle standing, causes a charge of 10 cents to be registered for each 6 minutes of waiting; this charge being added to the total. This is all arranged mechanically so that the driver has no control over the instrument except to start and stop it. On the passenger leaving the vehicle the driver throws the "Vacant" sign to a vertical position, resetting the figures under "Total fares," and turning the "Extras" to 0.

The instrument is also arranged so that it cannot be tampered with or put out of order, or the "Vacant" sign or extras changed while the driver is absent. This arrangement is necessary for the reason that maliciously inclined persons might change the tariff or ring up extras which, of course, the driver would have to account for to the company. In fact there has been some little trouble in this connection on account of the existing jealousy between the horse cab drivers and the "taxi" cab drivers. The "taxi" cabs being smarter and

more popular have been getting the bulk of the trade. When a "taxi" cab driver leaves his car for a few minutes, the horse cab driver rings up a few extras, etc., which makes the "taxi" that much out of pocket. To overcome this objection some of the cab drivers have arranged a small padlock on the taximeter, which, however, does not add to the appearance of the instrument.

Jones taximeters are now being manufactured, and will be leased to operators of taxi" cabs, horse cabs, etc., and the Jones

company attaches, repairs maintains and guarantees the instruments. It is believed that this is the only satisfactory method on which to operate the instruments. The inventor expects to visit Europe in the spring to introduce this taximeter and to dispose of the European patent rights.

ONLY A BIT OF BARE WIRE

But It Cost the Chauffeur a Long Search—One of the Many Elusive Causes of Motor Trouble.

"I think the hardest problem in automobile troubles that I ever encountered," said a professional driver whose years of experience entitled him to be heard with attention, "came to me one afternoon as I went out of the garage with only time enough to meet the owner as ordered and with no leeway for punctures or anything else. I started with everything working in fine shape, but when about two blocks had been traversed the machine slowed down and seemed to lose power with ever increasing rapidity. I headed back for the garage and could barely make it on first speed.

"The first symptoms were the same as would have been encountered with worn out piston rings letting the mixture into the engine base when the heat of the engine had made the oil thin, as we generally express it, but I knew that my engine was in prime condition and immediately eliminated that possibility from consideration and turned to the battery. A meter showed that I was right; the battery was way down; so I put in fresh cells and started again. I had not gone a block when I found the same condition to exist.

"Of course I was guessing. There was no use of looking at the timer except for short circuits, so I made a careful examination with that in view and satisfied myself that all the contacts there were well protected. The secondary circuit revealed the same satisfactory condition, the vibrations on the coil buzzed as they should buzz, and the battery connections were perfect—yet I had too little 'juice' to get explosions before the piston was way down; not enough spark to fire one compression.

"Again I put in fresh cells which I first tested with a large meter that I knew to be in perfect condition. The battery was all right, yet a little running on the floor weakened it perceptably and I was certainly stumped. I thought that it must be in the coil, yet when the plugs were laid on the cylinders and the engine turned over a fine spark resulted.

"I worked on that problem for nearly two hours. At last when tired and disgusted, the solution was found. A bit of insulation had worn away from one of the primaries on its under side just where it passed over the metal piece to which was attached the vibrator spring and this permitted a continuous flow from the battery—a direct circuit. The end of the wire was connected on the bridge and by its contact with the metal support of the vibrator a divided circuit was established permitting an abnormal consumption of current."

WHERE KNOWLEDGE IS REAL POWER

Guesswork Apt to Make as Many Troubles as It Mends—Some Suggestions for the Driver.

In the not distant past it was a common sight to see an automobile drawn up by the roadside, a miscellaneous assortment of tools beside it and the driver distorting himself into various attitudes, wonderful to behold, seeking the seat of the trouble that caused the delay. These sights are now rare, thanks to the improvements that have been made in construction, but more especially because of a general knowledge of the functions of the different parts of the gasolene engine.

While it is true that most drivers are able to diagnose symptoms and locate any disarrangement in a very few moments, it is equally true that there are many who are possessed of only a superficial knowledge of the construction of their power plant, and when something goes wrong it is more luck than good management if they succeed in remedying the difficulty.

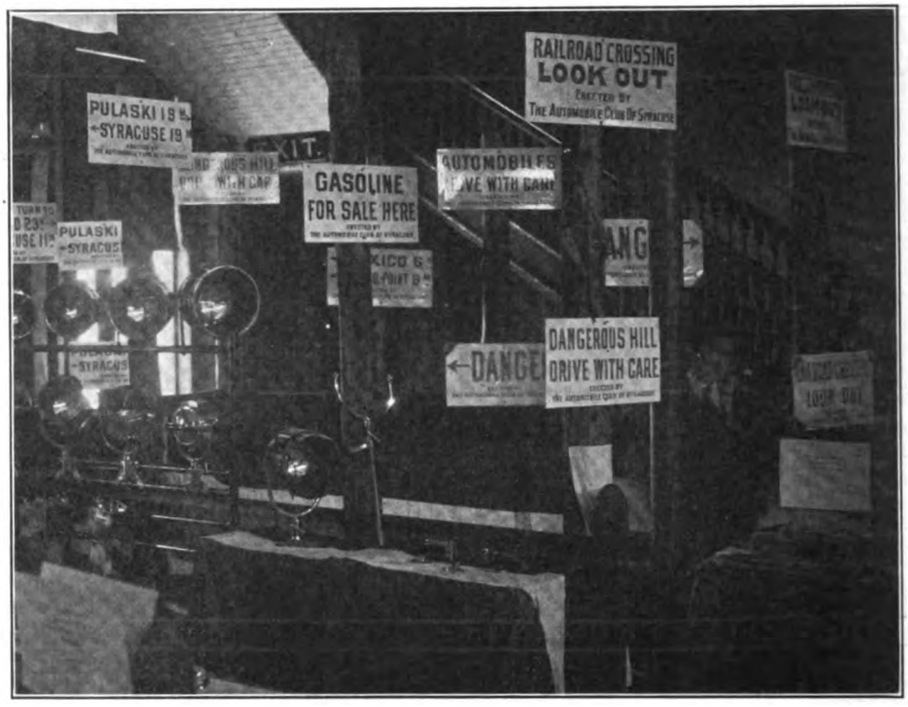
Of course the advice to this class is to learn all about their machine, as there are few disarrangements of the mechanism that are not easily adjusted, if one but knows where to look for them. The man who trusts to luck usually goes from one thing to another without rhyme or reason; he tightens nuts or changes adjustments with a vague hope that by some stroke of fortune he will hit on the right thing. Generally he does hit on it, but not until something else has been put out of commission by his unintelligent tinkering, with the result that when he attempts to start the engine—which had stopped, say, for instance, because of a loose battery connection—it fails to run because he has spoiled the adjustment of vibrators while looking for the initial trouble. He finally gets the machine running, but when similar symptoms are again apparent, the same lengthy investigation must be indulged in.

A good rule to follow is to never turn a screw unless you know why you are doing it. The policy of "guessing" makes far more trouble than it corrects. Every part of a gasolene engine has a definite purpose; and to alter its position, without having a thorough understanding of its functions, is simply to invite trouble. Do one thing at a time, know why you are doing it, and then try results before looking further and you will learn the significance of the different symptoms and be in a position to make all necessary adjustments or corrections in the least possible time and at the least personal inconvenience.

Glidden in Land of the Pharaohs.

Recent and contemporaneous part way round the world tours to which the automobile is more or less accessory have served to eliminate pretty largely from the popular mind interest in the only original globe girdling motorist, Charles J. Glidden, who probably would have been totally forgotten long ago did he not occasionally return to civilization to inform its peoples of his progress. Races from anywhere and nowhere to Paris do not affect Mr. Glidden's progress in the least, however. He is at present "doing" Egypt, with the Holy Land in immediate prospect. His present travels total 42,367 miles, and he plans to add another 2,000 miles to it before this stage of his peregrinations is concluded.

It is worthy of note in the light of other and more theatrical world touring ventures, that the Glidden junket is purely a pleasure exploit. When natives are hostile or roads are particularly rough, the Glidden party takes to boat or rail, or whatever happens to be the most comfortable mode of travel, while the car is sent around the other way, or packed along with the family luggage to some point where it may be put again in commission to add to the owner's world knowledge and automobile mileage.



Chauffeurs' Union Claims 978 Members.

The Chauffeurs' Protective Union of Greater New York has elected officers for the ensuing year as follows: President, A. Rogers; vice-president, C. Pollock; recording secretary, F. Kiernan; treasurer, Albert Oliver; board of trustees, John Harvey, three years; J. Brady, two years, and T. White, one year; business agent, J. Murphy. The organization was started a year ago with 265 members and now numbers 978, or at any rate that is the number given out for public consumption.

ROAD SIGNS OF THE RIGHT SORT

Placed for Guidance and Warning by the Automobile Club of Syracuse—Their Character and Variety.

With signs to the right of him, signs to the left of him, signs right in front of him, guiding his course, there is little excuse for the tourist, even "the stranger in our midst" encountering an unexpected condition or being required to seek information additional to that found on the signs which have been erected on guide post, telegraph pole and buildings along the roads in the vicinity of Syracuse, N. Y.

DISPLAY OF ROAD SIGNS AT RECENT FRANKLIN SHOW

With enterprise which is to be highly commended the Automobile Club of Syracuse have placarded the highways with signs which give warnings of dangerous curves, steep hills and uncertain roadways and with instructions as to where gasolene may be found, trolley and railroad crossings encountered; distances from place to place are given while arrows point out the roads. Local speed ordinances are proclaimed and the needs and desires of the automobilist are anticipated and the ways of obtaining them pointed out "so that he who runs may read."

These signs were displayed at the recent Franklin Show in Syracuse where they were grouped, as shown in the illustration.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

DEFENDS "SIX DAYS TICKET" IDEA

Commissioner Smith Discusses Constitutionality of Jersey's Proposed Tax on Non-resident Automobilists.

Study of the proposed changes in the New Jersey automobile law has led persons both within and outside that State to the conclusion that a special license for non-resident automobilists would be against the constitution of the State, falling under the head of special or class legislation. The issue has come to the attention of Commissioner J. B. R. Smith, who had the following to say in relation to it when the matter was broached in a newspaper interview:

"There has been much adverse talk in connection with the section of our law which provides that automobilists from New York or other States who use our roads are obliged to pay a license while in this State, regardless of the fact that they have already been licensed by payment of the fee required by their native State or States. Most of the criticism has, of course, been on the part of the foreign automobilists, or residents of other States, who can not see why they should pay two licenses for operating their machines, even though they do cross a State line in their travels. Some of our New Jersey automobilists take the same position because New York and other States do not charge them an additional fee if they have paid a license here. On all sides one great, important fact in connection with this particular phase of the automobile problems of legislation seems to have been forgotten. It is that our State Constitution inveighs strongly against special or class legislation, and that in the event of New Jersey exacting a license fee from its own resident owners and users of automobiles and not from foreigners resident or other States) who come into our State, such action could be upset by any New Jersey resident who cared to test its constitutionality. To me, and to others who have made the subject a study, it seems that for the State to specifically exempt foreign automobilists from a license fee, or to permit them to go free from such a tax without any legislation upon the subject, would be distinctly class or special legislation. It would be discrimination by the State against its own residents and in favor of visitors and would, to my mind, be clearly unconstitutional. Neither would it be fair, even if we waive the constitutional inhibition for argumentative purposes, because there are hundreds of New York and Philadelphia men who have summer homes at some one of the many resorts of world-wide reputation, along the New Jersey shore of the Atlantic, in which their families spend from four to eight months of each year, and to and from which they make daily trips in high power automobiles. They enjoy the trips from city to seaside in the evening and from shore to business in the morning by automobile vastly more than making the journey twice a day by boat or train. Besides, the trip can be made at any time and the owner need not bother about time tables or schedules and has only his own convenience to suit. He uses the excellent roads of New Jersey probably more than the automobilist who lives on or adjacent to those same roads and the State holds that it is but just and equitable to exact from him a license fee to be used for the up-keep of those roads."

Speaking of automobile legislation in general, Commissioner Smith expressed the opinion that as yet it is in an embryonic state throughout the country and said that eventually the whole subject will be regulated satisfactorily for all concerned. "I am of the belief," he said, "that we are as yet merely feeling our way toward the proper and generally satisfactory laws which will eventually result. They can not come in a day, nor at the very beginning, because various propositions must be tried out in a practical way before their strong or weak points can be determined and necessary amendments or corrections agreed upon. As the head of the State department having direct charge of the matter, I am ready at any time to give anyone an opportunity to take up any part of our automobile laws, either in court or otherwise, for the purpose of a test or to determine whether there is any injustice being caused or whether unfairness for or against the automobile interests can be shown. As an evidence of that I will cite briefly the fact that some time ago Mr. Yellott, a Baltimore lawyer, who is one of the quartet which handles the law business for the American Automobile Association, began an action in behalf of an automobilist of another State to test the power of attorney provision of the New Jersey law, which has been the subject of so much discussion, adverse and otherwise. My department prepared to meet the action and to carry it to an issue, in a thoroughly friendly spirit and with the idea that a legal adjudication of the matter would be a good step forward in the clearing of the atmosphere. I was really pleased that the action had been begun. You can therefore imagine my surprise when it was suddenly dropped and no explanation was offered for the change of front. I wish you would let it be known that no one need have any fear of offending the State authorities or the department of automobiles in particular by bringing any legal action directed against any part of our automobile law. We will welcome it in a friendly spirit and though we will, of course, put up the stiffest legal fight we know how, it will be entirely with the idea that adjudication of any part or all of the law by some competent court will be the means of showing us the right road to travel along the line of legislative regulation of automobile matters."

FLELINGHUYSEN FACES A FIGHT

Jersey Senator's New Automobile Measure to be Vigorously Opposed—Features that Provoke Antagonism.

Doubtless the ears of Senator Joseph Frelinghuysen, New York corporation lawyer and New Jersey legislator, burn, but as the insurance senator is used to this sort of thing he probably doesn't mind in the least the mean things automobilists are saying about him. The Frelinghuysen amendments to the Frelinghuysen automobile law as applied in New Jersey, which were introduced in the legislature of that State last week, have provoked more comment and more criticism and have placed the New Jersey senator more glaringly in the limelight than when his original bill was introduced more than a year ago.

That the proposed amendments to the present New Jersey law will not be passed without a strenuous fight on the part of the allied automobile interests goes without question. The New Jersey State Automobile Dealers' Association, in a meeting in Newark, Thursday afternoon last, fired the opening gun of the campaign to be waged against the proposed amendments by passing a resolution condemning them, and voting to circularize every automobile and accessories concern in the State, in an effort to arouse sentiment against the changes in the law now suggested by Senator Frelinghuysen.

Briefly summarized the proposed amendments consist of a sliding taxation of vehicles based upon horsepower, from $3 to $100 per year; a sliding scale for drivers' licenses, from $1 to $25; the granting of "admission tickets" to out of State motorists to use New Jersey's roads, at a cost of 50 cents per six days, and the abolition of manufacturers' and dealers' blanket licenses, besides a few minor changes.

This last provision is what the dealers in New Jersey object to. The present law compels the dealer to pay a license fee of $20 a year, which permits him to operate five cars. The amendments of Senator Frelinghuysen will, if they become a law, compel the dealer to pay a separate tax on each car. Another apparent injustice is that according to the proposed amendments it would be possible for a dealer from another State to go into New Jersey and demonstrate cars for the small sum of 50 cents, while it would cost the New Jersey dealer a large sum for each car.

A general meeting of dealers from various parts of the State will be held some time during the present week, when it is expected that a plan of action will be decided upon. In the meantime the associated clubs of New Jersey are arranging for a meeting to be held with the same object in view.

FINED FOR CARRYING TWO NUMBERS

Nice Point in Construction of Massachusetts Law—Local Garage Man Broke It by Trying to Obey It.

One of those complications that result from inability to master the intricacies so frequent in automobile laws furnished a case for Judge Parmenter, of the Boston Municipal Court one day last week. John P. Ware was arrested on a charge of unlawfully operating an automobile on Columbus avenue. The basis of the charge was that the machine carried two numbers. Ware showed to the officer his license to drive the car under one of the displayed numbers, and explained that he was employed at a garage where the car had been repaired, the purpose of his operating it at this time being to test the repairs. Nevertheless, he was haled before the magistrate. In court it was shown that the license exhibited to the officers by Ware was the one supplied to him by his employer, who was present in court to explain the situation. It appears that while the law grants a single license to a garage for all cars belonging thereto, this license does not cover cars sent in for repairs. The complication appeared to arise from the contention on the side of the prosecution that Ware should have had two licenses, corresponding to the two different numbers on the car he was operating. The garage proprietor had not thought this necessary, but he had thought it necessary, under the circumstances, for the car to carry both the owner's and the garage number. The decision of the case turned, however, on the declaration of the policeman that the arrest was made because of inability on the part of the policeman to decide, when a car came along with two different numbers, as to its ownership. Judge Parmenter took this view of the matter and fined Ware $10 for not having a license corresponding to the owner's number.

Bicyclists as "Chaperons" for Motorists.

In common with the British Motor Union the Association Général Automobile, of France, has established a body of cycle mounted scouts to protect the interests of its members by warning them of the danger of arrest for violation of any of the special regulations governing motoring practices. Instead of following the tactics of their over-channel brethren, who employed the scouts to warn motorists of the presence of speed traps, the new corps of the French association are instructed to patrol the streets and warn members of any infringement of the law, such as driving cars with smoking motors, or exceeding the speed limit. Their influence is thus directly in line with the purpose of the law. The force at present employed consists of twelve men, suitably uniformed and mounted on bicycles, who are patrolling the principal streets and boulevards of Paris.

Minneapolis Reduces Renewal Fee.

Automobilists and motorcyclists in Minneapolis will hereafter be required to renew their licenses each year, but they will be charged only 50 cents for each renewal, if the ordinance under consideration by the Minneapolis city council succeeds in passing, and the indications are that it will. When the ordinance first was proposed several weeks ago it required that motor vehicles be licensed annually at the fee of $2 as provided by State law. It was referred to the ordinance committee, a change resulting as stated. Licensees will be given the opportunity of taking the same number each succeeding year upon payment of the fee of 50 cents after the first year. Minneapolis motorists will have to carry two tags, one of the State and the other issued by the city. The latter will be distinguishable as they will contain the name, "Minneapolis" in addition to the number of the license and the year of issuance, a "very little" to place on one tag.

New York's Two Toll Gates Doomed.

Action toward the abolition of the only two toll gates left in New York State was taken by the Board of Supervisors of Erie county last week, when it adopted a resolution asking the county attorney to inform the board what legal steps can be taken to get rid of these two gates. The two gates are in Buffalo. County Engineer Diehl thought it high time that "these two ancient obstructions to traffic are removed," and said: "We cannot improve these roads under the good roads law as long as the toll gates remain upon them. I understand they are the only toll gates left in the State. This form of taxation on traffic is obsolete and should be ended in Erie county."

Piling on the Taxation.

Assemblyman Eagleton, of New York, has again presented in the legislature his two pet bills, which died a peaceful death during the last session. One provides that "no license shall be issued for an automobile in excess of 20 horsepower unless it is to be used for speeding or racing purposes"; the other gives a person who has been injured by an automobile, through the negligence or carelessness of the operator, a lien on the car until the claims for damages have been settled. On the same day Assemblyman A. E. Smith proposed that hereafter the tax on automobiles used for pleasure shall be $2.50 per seating capacity.

If ever the New York to Paris racers reach Siberia, a surprise is in store for all but one of them. The one is question is carrying with it flanges to fit its wheel rims and a permit from the Russian government to run the automobile across the country on the tracks of the Trans-Siberian railway.

FOR A ROAD THROUGH THE ROCKIES

Plan to Petition Congress for a Thousand Mile Highway—Western Business Men in an Organized Movement.

In return for the millions of dollars paid in taxes for river and harbor improvements in America, the business men of four western States will petition the next Congress to appropriate $10,000,000 for a road, 1,000 miles long, to be built from Yellowstone National Park to the Grand Canon of the Colorado river in Arizona.

This gigantic project was launched at a recent meeting of the Denver Real Estate Exchange, but the details were kept secret until last week. Harold Kountze has been named as treasurer, and another prominent western business man, it is stated, will be elected president of the Western Highway Association, by which name the organization which will work for the appropriation is to be known.

Colorado, Utah, Wyoming and Arizona will be asked to assist in the campaign for the road. The originators believe they will receive all the assistance necessary, as assuring letters already have been received from prominent men in these several States.

None of the States through which the proposed highway is to pass has sufficient finances to build it, but as it will be a great highway for travelers generally, it is argued that the road will prove of more importance than some of the inland harbors upon which vast sums are expended and from which the majority of westerners receive no apparent benefits.

While the plans of the organizers have not definitely been decided upon, it is the general opinion that Congress will be asked to donate the cost of building and maintaining and to establish a toll system which will repay the government for its expenditure. The proposed road will traverse some of the most famous scenic and historic spots of the Rocky Mountain region, including cliff dwellers' villages and at least one Indian reservation. As such a highway would attract countless tourists and result in consequent expenditure of money in the States named, it would therefore be of inestimable value to these States, not counting all the other advantages from well kept highways.

Placing Signs in the Ohio Valley.

A vote to purchase road signs, which the county commissioners have agreed to place, was the most important work of the Ohio Valley Automobile Association at its annual meeting in Wheeling, W. Va., last week. The report of the treasurer showed a balance of $275, which will be expended in signboards and work of a similar character.

The Week's Patents.

873,325. Spring for Vehicles. Patrick J. McGinn, Salisbury, Rhodesia. Filed Aug. 7, 1906. Serial No. 329,549.

A vehicle provided with heavy leaf main springs by which the body or bed is supported when weighted, and light supplemental springs connected with the front ends of the main springs and with the body or bed work by means of plates having downwardly curved portions over which the supplemental springs are passed, said plates being also provided rearwardly of said downwardly directed curved portions with keepers through which the supplemental springs are passed, and the rear ends of the main springs being also provided with supplemental springs connected therewith and with the body or bed work of the vehicle.

873,329. Vehicle Spring. Gustav Schmitt, Milwaukee, Wis. Filed March 18, 1907. Serial No. 363,091.

1. A vehicle spring comprising oppositely bowed springs connected together in the center, links connected to the ends of one of said springs, and rollers connected to the ends of the other spring and mounted to move in said links.

873,372. Intake Device for Explosive Mixtures in Vapor Engines. Clarence P. Hollister, Pittsfield, Mass., assignor to Stilson Motor Car Co., Pittsfield, Mass., a Corporation of Massachusetts. Filed Oce. 4, 1907. Serial No. 395,844.

1. A vapor mixture intake device for a six cylinder engine comprising three intake groups of two each, a single intake to each group, a continuous chamber into which the several single intakes open, a general chamber connecting at its respective ends with the said continuous chamber and a single pipe connecting centrally with the general chamber.

873,384. Radiator. Elmer L. Ogle, New York, N. Y., assignor to N. Leroy Otis, New York, N. Y. Filed Oct. 8, 1906. Serial No. 337,887.

1. A cooler comprising polygonal tubes having a longitudinal seam on one flat side provided with a rectangular enlargement at one end only and grouped alternately so as to leave spaces between such tubes, substantially as described.

873,385. Radiator. Elmer L. Ogle, New York, N. Y., assignor to N. Leroy Otis, New York, N. Y. Filed Jan. 7, 1907. Serial No. 351,095.

1. Steel radiator tubes adapted to be united by solder; tinned at the points where they are to be soldered, in combination with a superimposed coat of copper overlaying the tube including the tinned surfaces.

873,392. Carburetter. Albert E. Stokes, Dallas, Texas. Filed Feb. 7, 1907. Serial No. 356,204.

A carburetter consisting of a mixing chamber, an oil inlet pipe opening into said chamber, a hollow spreader within the chamber having a concave face upon which the oil drops, a tubular stem supporting said spreader and communicating with a source of heat, a valve in the oil inlet pipe, a passage connecting the mixing chamber and engine, a valve adapted to close said passages, and means connecting the valves so they will be simultaneously operated, said means being adjustably connected to the valve in the oil inlet, for the purpose described.

873,399. Combined Heating and Ventilating System for Automobiles. Nathan W. Williams, Evanston, Ill. Filed Nov. 2, 1906. Serial No. 341,737.

1. In combination with the structure to be heated, a hydro-carbon engine, an exhaust pipe leading therefrom, a muffler secured to the discharge end of the exhaust pipe and in open communication with the atmosphere, an inclosing box, secured to the structure to be heated and provided with an intake opening for supplying fresh air, a register in communication with the inclosing box for controlling the flow of heated air therefrom, a radiator box within the inclosing box, a branch pipe leading from the radiator box to the exhaust pipe intermediate the muffler and the engine, and a discharge pipe, leading from the radiator box and out of the inclosing box and discharging directly into the atmosphere, substantially as described.

873,405. Automobile. Franz Bartl, New York, N. Y. Filed Nov. 30, 1906. Serial No. 345,589.

1. A motor vehicle or automobile in which the actuating mechanism is located within the chassis frame comprising a drop axle with a stump on each end passing through the hub of a wheel, borings in said stumps, a wheel shaft in each boring, a ball bearing on each side of the wheel on the axle stump, a fourth ball bearing at the inner end of each shaft, and a standard bolted to the drop axle supporting the last named ball bearing and the inner end of the shaft.

873,434. Motor Car. James T. Hepburn, Lochwinnoch, Scotland. Filed Nov. 20, 1906. Serial No. 344,299.

1. In a motor car the combination with the front axle of a motor pivotally supported thereon, gear for driving the back axle, a shaft directly connecting said gear with the gear of the motor, a tube surrounding said shaft, a second tube arranged outside of the first one, the one tube being fixed at its front end and free at its rear end, while the other is fixed at its rear end and free at its front end in order that the wheel axles may take up different angles relatively with one another and to the horizontal.

873,453. Folding Seat Frame for Automobiles. James M. Nolan, New Haven, Conn., assignor of two-thirds to William H. Wilson and Charles Rasmussen, New Haven, Conn. Filed Aug. 23, 1907. Serial No. 389,848.

1. A folding seat frame for automobiles consisting of a bracket having outwardly extending slotted guides and transverse and longitudinal grooves, a seat spider having inwardly extending arms and fingers, a rod connecting said fingers and extending through the slots in the frame, one of said fingers adapted to ride in said grooves, substantially as described.

873,461. Change Speed Gear. Maurice Sizaire and Louis Naudin, Puteaux, France, assignors to Société des Automobiles Sizaire et Naudin, Paris, France. Filed Feb. 28, 1906. Serial No. 303,443.

1. A change speed gear for motor cars, motorcycles, and like comprising a driven axle, a toothed wheel secured upon said axle, a driving shaft having a universal joint, a number of change speed pinions capable of sliding on the said driving shaft and driving the said toothed wheel, means for moving laterally said universally jointed shaft to disengage said pinions from said wheel and for sliding longitudinally the number of pinions when these pinions have been disengaged from with the toothed wheel.

873,478. Lubricating Device for Automobiles. Frederick J. Ziegler, New York, N. Y. Filed April 2, 1907. Serial No. 365,965.

1. In a lubricator, the combination of a container for the lubricant, a shaft which controls by its angular position the discharge of lubricant from said container, a shaft journaled in said container and arranged for operative connection with the engine to be lubricated, and an operative connection between said shafts by which the discharge controlling shaft is rocked.

873,544. Automobile Bumper. Ray W. Harroun, Chicago, Ill. Filed March 29, 1906. Serial No. 308,683.

1. In an automobile bumper, a rail extending across the front of an automobile attached to the frame by horizontal arms running through the eye bolts at the frame ends and supported by brackets at the rear ends backed up by springs surrounding said horizontal arms.

873,620. Motor Vehicle. William C. Schwarz, Edwardsville, Ill. Filed May 29, 1906. Serial No. 319,358.

1. In a motor vehicle, a frame, front and rear axles pivotally mounted at their centers beneath the frame, traction wheels fixed on the ends of said axles, differential gearing arranged on the axles, pinions meshing with and driving said differential gearings, flexible extensible shafts arranged to drive the pinions, means carried by the frame for driving the flexible extensible shafts, a pair of cross rods pivotally connected at their ends to the ends of the axles, a rod pivotally connected to one of the cross rods, and means arranged on the frame for imparting longitudinal movement to the rod.

873,679. Band Brake. Frank O'Brien, Jackson, Mich., assignor to Buick Motor Company, Flint, Mich. Filed Dec. 18, 1906. Serial No. 348,431.

1. In a brake of the kind described, the combination of a wheel carrying a ring, an axle connected to the wheel, a tubular casing over the axle, having a circular head at the end fitting at its edge close to the ring, with a series of pins and a stop projecting into the ring, a split band supported upon the pins, with its ends arranged to abut the stop, and means to expand the band.

873,738. Vehicle Tire. John Eckhard, Buffalo, N. Y. Filed April 7, 1906. Serial No. 310,554.

1. A tire for wheels comprising a retaining member held to the felly of the wheel, a multi-part tire within said retaining member and each of the parts thereof having curved undercut grooves in the ends thereof, combined connecting and fastening devices between the several parts of the tire comprising each a crescent-shaped transversely disposed connector fitting the grooves in adjacent ends of two adjoining blocks and fastening bolts on said connector passing through said retaining member and the felly of a wheel.

873,764. Motor Starter. Adolph W. Manz, Chicago, Ill., assignor to Paul H. Manz, Chicago, Ill. Filed Dec. 24, 1906, Serial No. 349,356. Renewed Nov. 4, 1907. Serial No. 400,548.

1. A motor starter, including a lever, a ratchet wheel removably mounted upon the motor shaft, a pawl attached to said lever, a plurality of rock-bars mounted on said lever and having flexible connection with each other and with said pawl, means for operating the lever, a dog adapted to engage the said ratchet wheel during the reverse move-

Digitized by Google

ment of the lever and means for holding the said dog out of engagement with the ratchet wheel when the said lever is in its initial position.

873,841. Vehicle Wheel. Charles E. Cole, Cleveland, Ohio. Filed Dec. 26, 1906. Serial No. 349,423.

1. In a vehicle wheel, the combination with a pair of annular outer plates, of a shaft to which said plates are secured, a ring also secured to said shaft, said ring having a concaved outer periphery, a second ring surrounding the first named ring, said second ring having a concaved inner periphery, hollow rubber cushioning balls located between said rings, and plates secured to the outer ring which overlap the inner ring and which are entirely covered by the outer plates, openings formed in the plates that are carried by the outer ring, and projections carried by the outer plates which extend into said openings, said openings being larger than said propections.

873,903. Transmission and Speed Changing Mechanism. Eugene Schmidt, Stillwater, Minn. Filed Oct. 28, 1905. Serial No. 284,816.

1. Apparatus of the class set forth, comprising a suitable frame, engines mounted upon said frame, a drive shaft and transmitting mechanism, comprising fly wheels carried by said engines and having frictional drive faces, a frictional drive wheel in continuous peripheral contact with each of said faces, a sleeve feathered and free to slide on said shaft upon which sleeve said frictional drive wheel is journaled, a clutch between said sleeve and frictional drive wheel, means for sliding said sleeve to move said drive wheel across the faces of said fly wheels, and means for throwing said clutch into and out of operation.

873,910. Friction Clutch. Edmund Sprung, Detroit, Mich. Filed April 20, 1907. Serial No. 369,299.

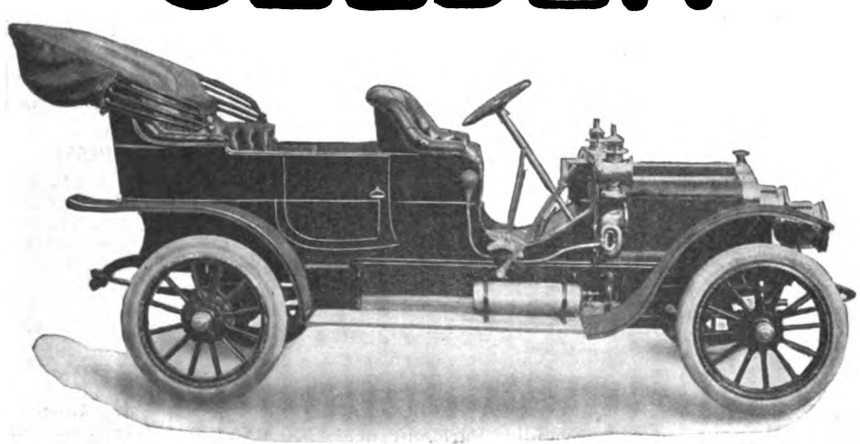
1. In a clutch, the combination of a friction disc or member having a smooth contact surface, a second friction member formed from a disc consisting of segments yieldingly held with their friction surface in different planes but registering with each other, and means for moving said second friction members into the same plane and into frictional contact with the other member.

873,911. Vehicle Wheel. Harold M. Starley, Coventry, England. Filed Sept. 18, 1906. Serial No. 335,124.

1. In road vehicle wheels, the combination consisting of a hub ring having circumferential seating apertures therein, screwed locking bolts seated within the said hub ring apertures, inwardly projecting driving studs secured to the wheel rim, and tubular metal spokes in engagement at their respective extremities with the said locking bolts and driving studs, as set forth.

873,926. Longitudinally Displaceable Car Body for Motor Vehicles. Rudolf Diesel, Munich, Germany. Filed Jan. 25, 1907. Serial No. 353,957.

In a motor car, a longitudinally displaceable car body, having rolls approximately in the vertical transverse plane passing through its center of gravity, said rolls being swingingly or otherwise movably mounted on the car body for enabling a lifting of the car body from the frame, and catch pieces mounted on the rear end of the under framing and arresting the rolls when the car body, after having been displaced, is tilted towards the rear side.



873,957. Vehicle Tire. George A. Parse, Jr., New York, N. Y. Filed March 9, 1907. Serial No. 361,474.

1. In a vehicle tire, the combination of a circular rim consisting of U shaped sections having an elastic outside covering of a ring adapted to be mounted on the felly, means for securing the ring to the felly, and elastic blocks interposed between the ring and the U shaped sections comprising the ring, substantially as described.

873,968. Electric Spark Plug. Frederick B. Thatcher, Providence, R. I. Filed Jan. 31, 1907. Serial No. 355,035.

1. In a spark plug, an outer shell having one end formed with screw threads on its interior and its opposite end formed with screw threads on its exterior, a shoulder formed on the interior of said shell intermediate its length, an outer core member extending in one end of said shell, and having an inner annular lip, a packing sleeve around said outer member engaging said interior threads and abutting said lip, an inner core member extending within the other end of said shell and having a lip engaging said interior shoulder of the shell, the outer portion of said last named end of shell being enlarged on its interior, a sparking point rod extending through said core members, a sparking point on said rod projecting into said enlarged interior of the shell, a collar on said rod to the rear of said point abutting said inner core member, said end of the shell surrounding the inner core member being formed with two oppositely disposed openings which expose said

THE SELDEN CAR

Model 28

Five Passenger Touring Car $2000 Three Passenger Runabout $2000

AN ATTRACTIVE CAR AT AN ATTRACTIVE PRICE

SPECIFICATIONS

Engine—4 cylinders, 4¼x4½, 28-30 brake horsepower.
Transmission—3 speeds forward and reverse, selective, Timken bearings.
Wheel base—109 inches; tread, standard; clutch, cone leather.
Body—sheet metal, straight line type, roomy and comfortable.
Tires—32x3½, quick detachable; make optional.
Frame—pressed steel, 4¾ inches deep.
Front axle—single I-beam drop forging, ball bearings.
Rear axle—bevel gear drive, enclosed type, roller bearings.
Ignition—synchronized jump spark.
Weight—empty, 2,200 lbs. (actual, not catalogue).

Represented in Greater New York by

sparking point, and a wire terminal secured to said last named end of the shell at right angles to said openings thereof.

873,978. Clutching Device Adapted for Use in Communicating Rotary Motion and in Controlling the Transmission Thereof. Frank Bailey and Frederick H. Jackson, London, England. Filed Dec. 27, 1906. Serial No. 349,686.

1. In hydraulic clutch mechanism of the character herein referred to, the combination, with an eccentrically formed casing or chamber and a disc formed with radial slots in which slab-like pistons slide, of a packing plate interposed between said disc and one wall of said chamber, and passages formed in said wall and leading from said plate to a controlling valve, whereby the liquid under pressure is admitted to the back of the plate, substantially as and for the purpose set forth.

874,075. Variable Speed Transmission and Reversing Gear. William S. Hovey, Three Rivers, Mich., assignor to Sheffield Car Company, Three Rivers, Mich. Original application filed Oct. 18, 1906. Serial No. 339,534. Divided and this application filed Jan. 16, 1907. Serial No. 352,645.

1. The combination with an engine crank shaft, of a transmission gear, comprising a driving transmission shaft connected to said engine crank shaft by a universal joint; gears arranged on said driving transmission shaft, said gears being fixed thereto, and said gear being revolubly mounted thereon; a clutch for securing said gear to said shaft; a transmission shaft; gears arranged on said transmission shaft to mesh with said wears respectively, said gears being revolubly mounted on said shaft and said gear being fixed thereon; a clutch mechanism for securing said gears to said shaft; a beveled gear on said shaft; a driven shaft; a pair of beveled gears revolubly mounted on said driven shaft arranged to mesh with said beveled gear on said shaft; and a clutch mechanism by which either of said gears on said driven shaft may be connected thereto, substantially as described.

874,114. Lubricator. Johannes T. Pedersen, Woodside, N. Y., assignor to Pedersen Manufacturing Company, New York, N. Y. Filed Feb. 21, 1907. Serial No. 358,545.

1. In a lubricating device and in combination, a series of oscillating cylinders, a series of reciprocating and oscillating pistons within said cylinders, means for simultaneously moving the said cylinders, and pistons, a power device for actuating the same, a body frame serving as a support for the said cylinders and means for conveying the oil to and from the respective ends of the cylinders and pistons with the movement of the pistons.

874,119. Roller Bearing. James E. Sackett, Sparrow Bush, N. Y. Filed June 8, 1907. Serial No. 377,971.

1. In a roller bearing, the combination of a shaft or axle, a casing having a circular series of spoke sockets and abutments at the inner ends thereof and also having smooth bores at its ends and annular abutments at the inner ends of said smooth bores, bearing rings arranged side by side within the circular series of spoke sockets an annular toothed recess, means connected an annular toother recess, means connected with the walls of the spoke sockets for detachably retaining said bearing rings in position, bearing rings arranged side by side in the end smooth bore of the casing and forming annular smooth grooves and annular toothed recesses, bolts detachably connecting one set of the latter bearing rings with the adjacent abutment of the casing, bolts detachably connecting the other set of the latter bearing rings to the adjacent abutment of the casing, sleeves detachably secured on the axle, within the casing, and forming circumferential grooves and circumferential toothed recesses, and three sets of anti-friction rollers interposed between the bearing rings and the sleeves and having smooth portions disposed in the opposed smooth grooves of the rings and sleeves and toothed portions arranged between and engaging the teeth of the rings and sleeves.

874,289. Circuit Closer for Explosive Engines. Thomas A. Bemus, Boston, Mass., assignor to T. Alton Bemus Company, Incorporated, Boston, Mass., a Corporation of Massachusetts. Filed Oct. 2, 1905. Serial No. 281,054.

1. The herein described circuit closer comprising a sleeve, a plug of insulating material carried by said sleeve, a casing mounted on and movable relative to said sleeve, a primary brush, a carrier therefor also mounted on said sleeve, a secondary brush carried by said plug, a secondary contact in engagement with said secondary brush, primary contacts mounted in said casing and with which said primary brush is designed to engage, secondary terminals also mounted in said casing in proximity to the plane of movement of said secondary brush, and a secondary binding post in engagement with said secondary contact.

874,388. Clutch. Thomas J. Butler, Harrison, N. J. Filed Jan. 24, 1907. Serial No. 353,913.

1. A clutch comprising a driving cone, a driving shaft connected with a portion of said cone, a shaft to be driven, said shaft being normally disconnected from said driving cone and said driving shaft, a positive clutch disc, and a series of independently acting friction-cones, all arranged to be successfully operated for producing a combined active engagement of said clutch disc and said friction cones, and each friction cone receiving its maximum amount of thrust before the next following cone section is brought in operative contact, substantially as and for the purposes set forth.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

FRANKLIN

Type D Runabout, 28 h. p., $2850

How Much Motoring for How Much Money? That's the question

No heavy motor-car justifies its running expense.

The light-weight Franklins give you equal or better service for less money. They have all the power you can use; and it is always at the rear wheels. They are handsome, roomy, absolutely strong; more comfortable than any steel-frame motor-car. They get the most out of the fuel; cut your tire bills in half, and—having no water system to freeze—are ready for business every day in the year.

Demonstrations by appointment. Any Franklin dealer will gladly show you.

Solar Lamps

"SHOW THE WAY"

From a Simplicity Standpoint

The "Solar" has fewer parts than any other lamp. That means simplicity of construction—a point vitally necessary in the building of an automobile lamp. Parts are drawn from heavy sheet brass—and when assembled are riveted—not soldered. The internal method of screw assembling used by us leaves a smooth exterior permitting ease of cleaning.

The Miller Automobile Jack

The Miller Automobile Jack is a quick acting, automatic lowering jack, designed especially for automobile use and is adapted to the factory or garage, as well as to be carried as a part of the equipment on motor cars. The Miller Jack is constructed of the best material and every part is machine finished, and in material, workmanship and finish it is a high grade and one of the finest finished jacks on the market.

We guarantee this jack for 12 months, and at the price, it is the best value ever offered to the automobile trade.

We are in a position to quote a special price to manufacturers, jobbers and dealers who buy in quantity.

The list price of the Miller Jack, guaranteed for 12 months, $3.50 each.

Our Catalog—the largest of its kind, mailed on request.

Garford

The making of gasolene automobiles is no longer a matter of experiment. Further immediate radical change in motor car design is most unlikely.

This point was reached three years ago. Since that time the Garford chassis has been the same as to "TYPE."

The new cars that are most likely to be out of date in three years are those containing the greatest number of variations from the established "TYPE" of to-day.

The Garford, orthodox in design, and extravagant only in workmanship and refinements, is the car to satisfy the man who buys his automobile as a permanent investment for years to come.

Triumph Grease, What Is It?

¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

The Perfection Grease Company, South Bend, Ind.

Crank Shaft on Center

Rambler

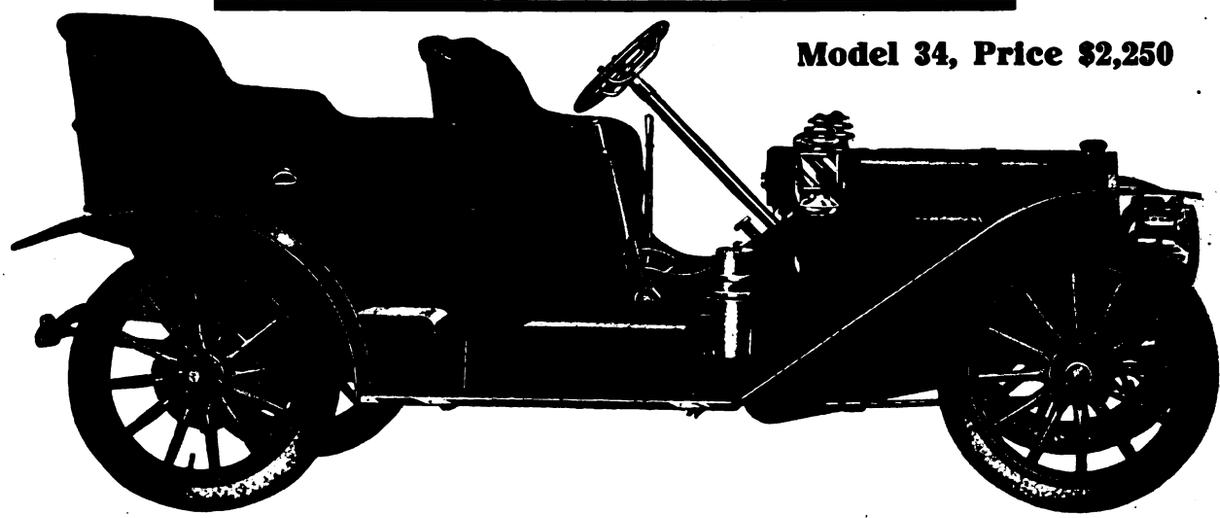
Crank Shaft Offset

Why the Offset Crank Shaft

One of the greatest improvemen·s in motor construction is the offset crank shaft. Its advantages are positive and direct.

First—By practically eliminating the dead center the efficiency of the motor is greatly increased through the greater leverage and more direct thrust from piston to crank shaft.

Second—Increased life of the motor through reduction of side thrust on cylinder walls and consequent saving in wear.



Third—Reduction in vibration and increased steadiness of running through more direct application of power generated in the cylinders.

Like many other fundamentally good features this must be done right and in the Rambler it is right both theoretically and practically and the result is a motor that combines the highest degree of efficieny with long life and economy of operation.

It is this and other features of equal value that make

The Car of Steady Service

Model 34, Price $2,250

This four cylinder chassis, equipped both as a 5-passenger touring car and 3-passenger roadster. Price of each style $2,250. The Rambler Utility Car with double opposed motor, $1,400.

RECEIVER FOR THE RELIANCE

Detroit Truck Manufacturers Forced to the Wall—Expect to Pay All Claims and Reorganize.

On petition of the Union Trust Co., trustee, Victor N. Gurney was, on Monday last, 24th inst., appointed receiver for the Reliance Motor Car Co., Detroit, whose plant is closed. Gurney gave bond for $25,000. This, it is announced, is one step toward the reorganization of the company with a larger capitalization. All creditors and stockholders, it is declared, will be taken care of.

The Reliance Motor Car Co. was incorporated in 1904 with $400,000 capital, and of late has been engaged almost wholly in the production of commercial vehicles. The company had authority to issue $150,000 bonds, of which $130,000 were sold and $20,000 remained in the treasury. The Union Trust Co. was trustee under a mortgage to secure the bonds.

There are several large claims against the company and one foreign company has begun an action to collect. The directors declared in court that a sale of the property by the receiver at this time would result in creditors losing half their claims, while with the reorganization they could be taken care of and the concern put upon its feet.

A circular issued to the creditors by the board of directors after the appointment of the receiver, says:

"A sale to such a new organization will enable the creditors to derive benefits from the business of the new company, and will continue the manufacture of Reliance trucks. The outstanding bonds, under the mortgage, amount to $130,000, there being $20,000 of bonds remaining in the treasury. The holders of the bonds outstanding, desiring, if possible, to preserve the good will of the enterprise, and believing that more will be realized by such a plan than through a forced sale by receiver, have been prevailed upon to permit their former offer to stand, providing for the issuance of the remaining $20,000 of bonds to be placed in the hands of Frank G. Smith, cashier of the First National Bank, of Detroit, Mich., as trustee, as security to the creditors, provided that within ten days they all agree to accept said security, and authorize Frank G. Smith, as trustee, to join with the present bondholders in disposing of the property to the best possible advantage.

"This will give the creditors a proportionate share of the proceeds of the property with present bondholders. If stock is received, it is confidently believed it can be readily converted into cash."

Dayton's Quick Recovery from Big Fire.

Fire which broke out in the trimming room of the Dayton Motor Car Co.'s plant at Dayton, Ohio, at 1 o'clock Friday morning, 21st inst., caused a loss of approximately $150,000, which is fully covered by insurance.

What caused the fire is a mystery. Fed by the light nature of the stuff in the trimming department, the flames spread rapidly to the stock room wherein were stored bodies, trimmings, supplies, etc., and while the firemen did good work and confined the flames to the older of the two buildings which comprise the Dayton plant, the new concrete building was considerably damaged by water. Before the last engine had left the wreckage, however, the Stoddard-Dayton staff had moved its offices to the new concrete structure and was doing business the following day, when several shipments were made. While the loss is severe, it will not materially affect the operations of the company or delay deliveries more than two weeks, the company having risen to the occasion with characteristic enterprise.

Insurance Rates Raised in St. Louis.

Because of several recent fires, in one of which a loss of $200,000 was involved, the St. Louis survey bureau has increased its rates on automobile garages, repair shops and factories. The increase ranges from 25 to 75 per cent.

SELDEN SUITS GIVEN NEW TURN

Judge Holt Rules that Judgments by Agreement do not Establish Validity—His Far Reaching Opinions.

Litigation involving the Selden patent was given a new turn on Saturday last when Judge Holt, sitting in the United States Circuit Court for the Southern District of New York, handed down his decision in the suit of the Electric Vehicle Co. vs. the De Dietrich Import Co. and Walter G. Allen, who formerly was the active man in that concern, and who later became interested in the importation of Mercedes cars and still later in the manufacture of the Allen-Kingston car.

The De Dietrich company, through Allen, secured a Selden license and when he began handling the Mercedes, he was promptly sued for infringement by the Selden interests, which suit he permitted to go by default. When he took up the Allen-Kingston car, the Electric Vehicle Co., as owners of the Selden patent, sought to have him punished for contempt in violating the terms of the decree and injunction entered at the time of the default. When contempt proceedings were instituted, Allen moved to have the default reopened.

This motion Judge Holt denies, at the same time defining the obligations entailed by the execution of such contracts recognizing patents and also pointing out very clearly why a judgment obtained by default is as binding as one secured in a contested case. The court holds, however, that as the Selden patent never has been declared a pioneer patent in a contested suit, and as no evidence was submitted to prove that the Allen-Kingston car is an infringement of the patent, he hesitates to punish Allen for contempt and accordingly denies that motion.

Judge Holt's interpretation of Judge Coxe's opinion, which has served as one of the main props of the Selden litigation, is

Digitized by Google

far reaching. In effect it says that a suit in which judgment is obtained by default or agreement does not establish the validity of a patent, but applies only to the particular parties to such proceedings. Judge Holt's opinion in full is as follows:

I think that the motion to open the default should be denied for the following reasons:

1. The term at which the decree was entered had expired before the motion was made. 2. The defendants were guilty of laches in making the motion. 3. No valid excuse is shown for the default. 4. The evidence satisfies me that the defendants, after full consideration, concluded to make no defense, and had no intention to move to open the default until after the motion to punish for contempt was noticed.

On the question whether the defendants have been guilty of contempt I have felt some hesitation. On the one hand, a final decree and an injunction issued pursuant to it should, in a patent case, as in all other cases, be effectively enforced. A decree pro confesso should be enforced just as effectively as any other decree. The fact that the defendant Allen, at first individually, and afterwards through the company which he had organized, took out licenses from the complainants authorizing him to import and sell in this country the De Dietrich machine affords a strong legal presumption that he admitted that the Selden patent was valid and that it covered the De Dietrich machine. The fact that, in consideration of obtaining such licenses, he executed contracts agreeing not to sell any gasolene automobiles not licensed by the complainants affords a strong presumption that he admitted that the Selden patent was a pioneer patent, covering all gasolene automobiles of the usual type. The fact that he permitted a decree to be taken against him by default, holding that he had infringed the patent by importing and selling the Mercedes machine, establishes as to him that the Mercedes machine is an infringement of the Selden patent, and, therefore, as to the defendant Allen, it may be a proper test, in order to determine whether the Allen-Kingston automobile infringes the patent, to compare it, not only with the patent, but with the De Dietrich and Mercedes machines. On the other hand, the fact that Allen suffered the decree to be taken by default strictly establishes only the truth of the facts alleged in the bill. He admits that he had imported a few Mercedes machines, and the fact that he permitted the decree to be taken in that case simply establishes that he had no defense to make to that charge. The decree did not establish that the Allen-Kingston automobile infringed the Selden patent. It did decide that Allen had infringed the patent by importing and selling the Mercedes machines, and the decree thereupon enjoined him from doing anything to infringe the patent.

If, therefore, the Allen-Kingston automobile is obviously, upon mere inspection, an infringement of the Selden patent, the motion to punish him for contempt in offering to sell it should be granted. The question whether it is obviously an infringement seems to me to depend upon the question whether the Selden patent is a pioneer patent or not.

If the Selden patent conveyed to the patentee a monopoly, in this country, of the right to make and sell any gasolene automobile of the usual types, then I think that the points of distinction alleged in the affidavit of Mr. Smith are immaterial, but if the Selden patent is not a pioneer patent covering the entire fundamental principle of the gasolene automobile, but simply is a patent for a particular kind of a gasolene automobile, I think it at least doubtful, in view of the grounds of distinction pointed out by Mr. Smith, whether the Allen-Kingston automobile infringes.

It is claimed that the opinion of Judge Coxe shows that he held the Selden patent to be a pioneer patent, and its language, at first reading, seems to tend to sustain that claim; but I think that the opinion of Judge Coxe should be read in the light of the real question before him, and I cannot see how the question of the absolute validity or invalidity of a patent can be determined upon a demurrer which is based simply upon the claim that the patent is void on its face. If the patent shows on its face that it is void, that fact may be determined upon a demurrer; but it seems to me that a decision upon such a demurrer upholding a patent cannot be conclusive on any defense which depends on extraneous proof as for instance, anticipation by earlier patents, or by inventions described in earlier publications, or by prior use, or any of the many defenses which may be set up to the validity of a patent which are not apparent on its face. I therefore cannot see how the decision of Judge Coxe upon the demurrer establishes conclusively that this patent is either a pioneer patent, or is valid, and admittedly there has been no decision rendered after a hearing upon the merits on proofs taken. Moreover, there are facts in this case which support the suggestion that the complainants have hesitated to bring such a question to actual decision.

The patent was applied for in 1879. It was granted sixteen years later, in 1895. Nearly thirteen years have since passed, during which the complainants have asserted that they had a pioneer patent, and have caused many persons to take out licenses from them, and have collected, according to the motion papers, about $1,500,000 for license fees, without bringing to actual trial a case testing the question of the validity of this patent on the merits. Several such cases have been brought. One was a case against the Winton Carriage Company, in which the complainants took their prima facie proofs, and the defendant had nearly completed its proofs, when the case was compromised, and settled out of court. As early as 1903 suits were brought by the complainants against the Ford Motor Company and the O. J. Gude Company, for the infringement of the Selden patent, and as early as 1906 suits were brought by the complainants against the Panhard Company. In all these suits defenses were interposed on the merits, but the testimony never has been completed, and the cases never brought to a hearing.

The claim put forth upon this motion is that the Selden patent is a pioneer patent, and that all makers of gasolene automobiles of the usual types infringe the patent. So serious a claim as this ought not to be upheld by the courts unless the complainants either have established the validity of the patents in a contest litigation, or have been ready to do so without delay whenever an opportunity has been offered.

If this motion is granted, it will be urged, as the decision of Judge Coxe on the demurrer has been urged, as an adjudication that the Selden patent is a pioneer patent, and that all makers of gasolene automobiles must have a license. I think, on the papers submitted, that there is sufficient doubt whether the Selden patent is a pioneer patent, and that, if it is not a pioneer patent, there is sufficient doubt whether the Allen-Kingston automobile infringes, to make it improper to grant this motion.

My conclusion, therefore, is that the motion to punish the defendants for contempt should be denied.

The Week's Incorporations.

Los Angeles, Cal.—Auto Machine Works, under California laws, with $20,000 capital. Corporators not named.

Chicago, Ill.—Joseph B. McKeague Co., under Illinois laws, with $5,000 capital; to make automobiles and accessories. Corporators—James B. Leahy, K. Neale and J. McCarthy.

ROYAL'S CREDITORS TAKE ACTION

Vote to Reorganize Company on Basis Suggested by Receivers—Plan Adopted and Committee Appointed.

As a result of the meeting of the creditors of the Royal Motor Car Co., held in the factory in Cleveland, Ohio, on Thursday last, 20th inst., it is practically assured that the company will be reorganized on the basis suggested by the receiver, that is, by capitalizing its indebtedness, the creditors accepting preferred stock in payment of their claims.

A resolution to this effect was adopted and a committee of seven creditors appointed to carry out the plans. The committee is composed of C. E. Adams, vice-president and manager Cleveland Hardware Co.; B. W. Browne, president Great Western Oil Co.; H. E. Andress, representing Diamond Rubber Co.; William H. Foote, cashier Wyman & Gordon; S. F. Haserot, president Haserot Canneries Co.; H. H. Hill, secretary Cleveland Tanning Co.; H. S. Black, treasurer Ohio Brass Co.. The committee was given broad powers and has authority to proceed with the reorganization whenever it deems that a sufficient number of creditors has assented to the agreement.

The plan is to form a new corporation with $500,000 of 6 per cent preferred stock and $520,000 of common, $100,000 of the latter to be termed bonus stock, and of which 25 per cent. will be presented to the managing director and the remainder to whomever he deems worthy of it. The voting power will remain with the preferred share holders until 50 per cent. of their holdings have been retired, when the power will be divided with the common stockholders. The exact plan as proposed is as follows:

(a) A new corporation to be formed of the creditors to take over all the assets of the old company, the consideration of such transfer being the assumption by the new corporation of all the liabilities of the old company, and the issuance of common stock as hereinafter provided.

(b) Issue preferred stock in said corporation to an amount not to exceed $500,000, which preferred stock shall be preferred both as to assets and dividends, and shall be subject to 6 per cent. annual dividends, payable quarterly from and after April 1st, 1909. All preferred stock to be issued to present creditors in the manner hereinafter provided:

(c) Issue common stock of the new corporation to the amount of preferred stock of the old corporation, four hundred and twenty thousand dollars ($420,000), plus one hundred thousand dollars ($100,000), to be used as bonus stock, as hereinafter described; common stock to be issued to the old company to said amount of $420,000, and the bonus stock to be divided when all of the new preferred stock shall have been retired, and the book value of the new common stock is par; such division to be as follows:

Twenty-five (25) per cent. to the managing director, and the balance to the others in the discretion of the managing director.

(d) The net profits of the new corporation, after paying the dividends on the preferred stock, shall be applied to the redemption at par and accrued and unpaid dividends of the preferred stock; provided, however, that if the directors so elect, they may retain out of such net earnings as surplus, a sum not to exceed in the aggregate one hundred thousand dollars ($100,000). Said preferred stock is to be redeemed from the holders thereof pro rata, but not in sums of less than one hundred dollars ($100).

(e) The voting power to be in the preferred stock, and the common stock to have no representation on the directory until fifty (50) per cent. of the preferred stock shall have been retired. The voting power then to be divided with the common stock, on a basis of four to one.

(f) For all claims in excess of $100, one share of said preferred stock for each $100 of said claim, and one-half share of said preferred stock for each fraction of $100 equal to $50, and cash for fractional parts of $50.

(g) For all claims for less than $100 each, cash to the full amount thereof.

Dream Story of Packard's Purchase.

Because M. J. Budlong, a former president of the Electric Vehicle Co., Hartford, Conn., is about to become assistant general manager of the Packard Motor Car Co., Detroit, Mich., a fertile brain able to appreciate the stuff of which dreams are made, promptly set afloat a story that the Packard company would take over the bankrupt and idle Electric Vehicle plant and operate it as an Eastern factory. The report was printed in Hartford on Saturday last and raised false hopes in the breasts of hundreds of former employes of the Electric Vehicle Co. Four days later, the "news" reached that staunch European advocate and stock market booster, the New York Herald, which "featured" the rumor and added to it a few dreams of its own. Everything about the story is correct except the truth of it. The improbability of the Packard company's, or any other company's, purchase of a bankrupt plant which is weighted with nearly $2,500,000 of bonds, to say nothing of other heavy obligations, should be apparent to any one not given to dreams.

The New York Herald also concocted a tale that the sale of the Pope-Toledo factory to the Dayton Motor Car Co. practically had been consummated. The tiny grain of truth in the tale is that when fire damaged the Dayton plant, the Pope people courteously wired the Dayton company placing the Toledo plant at their disposal.

TWO RICHMONDS IN THE FIELD

Each Otherwise Named the Philadelphia Taxicab Co.—Prospective Fight for Quaker City Franchise.

Two rival taxicab companies of the same name, but incorporated in different States, are to make a fight for the privilege of introducing in Philadelphia a system of registered cab service similar to that now operated in New York, according to advices from the Quaker City. Scarcely had the Philadelphia Taxicab Co., of Pennsylvania, whose charter was approved by the governor of that State last week, begun the work of organization, when the Philadelphia Taxicab Co., of New Jersey, made its appearance. The Pennsylvania corporation was formed by the Corporation Trust Co., an organization that makes a business of obtaining charters for persons in New York hiding behind the name of their counsel. As the name of the real incorporators in both companies have not been divulged, Philadelphia is awaiting developments.

Jeffery Buys His Old Chicago Factory.

It transpires that the man who purchased the former Rambler plant in Chicago from the receivers of the Pope Mfg. Co. is none other than Thomas B. Jeffery himself. The factory is an impressive brick structure on North Franklin street, and was built by Gormully & Jeffery when their Rambler bicycle was in its heydey. It was taken over by the "bicycle trust" and in sequence became a Pope possession. In it the first Rambler automobile was developed. The price paid by Mr. Jeffery was $100,000. The plant was carried on the Pope books at $250,000, which is close to its real value.

Witherbee Gets Broadway Location.

The Witherbee Igniter Co., now located at 541 West Forty-third street, New York, has leased a part of the third floor of the Motor Mart, 1876 Broadway, and is making ready to remove its factory and offices to that address. The new location will afford some 8,000 square feet of floor space.

Botto Again Visits the Coast.

W. M. Botto, sales manager of the Palmer & Singer Mfg. Co., is making an extended tour of the West and the Pacific Coast. As he is familiar with the country he reports that he had experienced no trouble in interesting the trade in the Simplex and the other P. & S. cars.

To Make Motor Buggies in Massachusetts.

W. A. Shafer, Frank Dodge and J. R. Graves, formerly of the Crown Automobile Co., Amesbury, Mass., have organized in that city the Crown Motor Vehicle Co. They will make high wheeled motor buggies.

An Unusual Proposition

ARE YOU AUTOMOBILE DEALERS MAKING MONEY?

If not, why not? Is it because your apparent profit is wiped out by after-sale contingencies? Is it because your business system is faulty, your methods disorderly and careless? Is it because you are located in a district where the line of cars you sell is not adapted or in demand? Is it because you are a skimmer, not doing the business seriously, as though you had no real place in business life? Is it because you consider the selling of automobiles a game rather than a business.

The fact that so large a number of retail automobile dealers are not making money, and I am happy to say that there are few Maxwell dealers among this class, is a matter of serious concern to those in the industry.

Now, you know me; you know that I must have a good deal of experience, that my plan of covering territory has been successful; that I know the business end of the automobile business; that my plans carry.

Now I have, like our friend from Boston, a remedy. Ha, ha, you say to yourself, pretty cute. He means to tell us to sell Maxwell Cars. Yes, that's part of it, but not the only part. I have deeper reasons.

To accomplish, I want first to get into communication with you, to become better acquainted. Let me send you The Co-Operator, our own automobile paper, free for three months. I will lead up to my plan in it. It will be a valuable educator, and in due course I will give you the complete details of my remedy.

Of course, The Co-Operator says a good deal about Maxwell Cars, but it has another mission to you. It will lead to a better understanding between us, so that later I can make you a lot of money.

Apropos of Maxwell dealers making money, it is because Maxwell Cars, while not yet absolutely perfect, are the nearest perfect, and because of their correct mechanical principles; unit construction; three-point suspension; natural water cooling; multiple-disc clutch; metal bodies; and all the other distinctive Maxwell features produce satisfied users, and every user becomes a salesman and a booster. Will you please cut out the blank below and send in at once? Let us begin the good work now.

Benj. Briscoe President.

Notice This in no way carries with it the slightest obligation, but I do it simply because Briscoe asks it and I want to be a good fellow.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

White Wins Quaker City Endurance Run

In the Endurance Run held January 1-2 by the Quaker City Motor Club, the White Steamer was the only car which made a perfect score on the road and also was declared by the Technical Committee to be in perfect condition at the finish. The Contest Committee would not abide by the decision of the Technical Committee. They gave credit for perfect scores to two other cars and ordered a "run-off."

The supplementary contest, held January 4th, served only to emphasize the superiority of the White. The examination then made by the Technical Committee placed the White far in the lead and, accordingly, the MacDonald & Campbell trophy was awarded to the White.

With our entry of one car, we decisively defeated 27 gasoline cars representing 23 different makes. Thus has another important factor been added to the long list of triumphs achieved by the White—the distinctively American car.

The A. A. A. and the Amateur.

Even a slight improvement is better than no improvement at all. On this principle, the amateur definition drafted by the A. A. A. racing board is a very welcome sign. It is evidence both of a desire to place automobile competition on the basis of real sport and of recognition of the fact that when cash comes in at the window, sport flies out at the door.

No man can be an amateur sportsman who competes for cash and the A. A. A.'s tardy recognition of that fundamental truth is a long step in the right direction. The A. A. A. rule will, however, still permit professionals to compete against amateurs, which is contrary to the letter and spirit of all other amateur rules, and is a lapse which will not only prevent the general and unquestioned acceptance of A. A. A. amateurs in other sports, but is one that will serve to defeat the very desirable object of encouraging and building up a class of unquestioned sportsmen. Of course, promoters may restrict races to amateurs but as in unrestricted events the professionals will be able to compete and as it is their competition that has caused and will cause the amateur sportsman to hold aloof, the improvement of the situation will be circumscribed. In such "mixed" events it is obvious that option of cash or plate as prizes must be afforded and it is equally clear that the shady amateur never will accept the cash unless he happens to win or unless the purse is sufficiently large.

The A. A. A. amateur rule is, therefore, a half-professional rule. Why generations of experience on the part of the rest of the world should be thus flouted or set at naught is past understanding. For experience, they say, is the best teacher.

The elimination of the silly stipulation that every one who chanced to be identified with the trade in any capacity was, ipse facto, a professional is a wise move; and while the underlying motive in relegating only demonstrators, testers and chauffeurs to the professional class, is understandable, it is not a fair one. No man's occupation decently can be made a test or measure of his sportsmanship. We can name some demonstrators—aye! and a few chauffeurs—who are educated gentlemen and better amateur sportsmen than some men of millions. Or does the A. A. A. rule mean that it is only while the men pursue those callings that they are professionals and that they become amateurs when they engage in other pursuits? The language of the definition easily is capable of this construction.

In one other respect, the definition fetches things too far. When the A. A. A. attempts to say that it will be the supreme judge of amateurism—when it relegates to itself the right to reinstate as an amateur a man declared to be a professional by any other sports governing body, its position becomes untenable and indefensible. Such an assumption of power is not merely arrogant, but discourteous, and would make ducks and drakes of all sports. It would bring the A. A. A. into disrepute and into conflict with every other organization in existence and render absolutely impossible the co-operation of those who may be anxious to co-operate with it. The wise heads of the A. A. A. should not permit such a provision to be placed on their books.

The other lapses in the proposed rule chiefly are those that will concern the A. A. A. racing board itself. The framers of the rule undoubtedly know to what they refer as "valuable consideration" and as "partial means of livelihood," but those elastic terms surely will return to vex racing boards of the future. In the absence of any requirement of registration, how promoters, or the A. A. A. itself, will be able to keep track of or distinguish the amateurs and the professionals, is past understanding. Apparently they will have to accept each competitor's personal assurance regarding his status. If this is not the case, will Chairman Thompson be able to supply on request a list of those comprising the two classes? If not, who will be able to do so?

The trouble seems to be that while "wrestling with the amateur problem" as a long and much traveled field of endeavor, it is a brand new one for the A. A. A. and the A. A. A. seems unable or unwilling to profit by the experience of the rest of the world, though willingness of the sort would greatly relieve its burdens. Happily, it is not yet too late for it to "be wise in time."

Relation of Design to Skidding.

Skidding and methods of preventing it, first and last, has been one of the most popular topics of technical and laical discussion ever broached. But aside from the two factors of steering angles and differential gearing, the parent subject of turning resistances, and, in fact, the entire static or dynamic condition of the vehicle sectionally and as a whole when turning, never has been brought to notice sufficiently, nor studied with the care and attention it deserves as being of vital importance to the design of the vehicle.

It is easy enough to compute the amount of force necessary to divert a moving body of known weight and velocity from a straight into a curved line of travel. How that force is distributed throughout the fabric of the automobile, and how the distribution of the resistance is to be effected, is at once a complex and difficult subject to deal with.

In a recent editorial in these columns relating to the subject of front driving and control of the vehicle, the suggestion was offered that, "the subject of transmission and traction losses on curves . . . . remains in its entirety to be investigated experimentally." That good progress in the preliminaries to this study is already being made is shown by frequent contributions

Digitized by Google

from engineers on kindred matters. Typical of these, is the statement of H. W. Alden in his paper on roller bearings, printed elsewhere, that frequently the end thrust on the bearing of a front wheel may be fully equal to the radial load due to the weight of the car. "When turning a corner of twenty-five foot radius at fifteen miles per hour," he says, " . . . . the end thrust on that front wheel bearing which gets the maximum thrust is just about the same as its legitimate load." What may be the maximum thrust on a rear wheel bearing during a severe skid, he does not attempt to say.

Without this factor in its makeup, due to the necessity of self guidance as well as self propulsion, the motor vehicle problem would be identical with that of the locomotive so far as the mechanics of the matter is concerned. Structurally the organs representing this difference are the steering gear and the differential. The methods by which they are applied, however, serve to introduce sundry other considerations, such as the friction losses in transmission due to differential action, not only on curves, but whenever varying adhesion causes one wheel to travel faster than the other; the traction losses due to side-slip in the steering wheels; skidding in all its phases; and in fact quite the whole behavior of the vehicle on the road.

These are the characteristic and determining organs of the vehicle. Yet, oddly enough, while motors, transmissions, bodies, and accessories have been undergoing tremendous improvement during the past few years of automobile development, these two groups remain identical in principle and largely the same in construction as developed in the early stages of the industry.

New Jersey's Glorious Opportunity!

The tunnel under the Hudson River which connects New York and New Jersey formally was opened on Tuesday last. Among the invited guests on the first official train were Governor J. Franklin Fort and Senator Joseph S. Frelinghuysen of New Jersey. The fact furnishes ground for suspicion that shortly there will be introduced into the legislature at Trenton a bill requiring all New Yorkers who use the tunnel route to pay a registration or other admission fee and to display a tag. And why not? As the Jerseymen pay taxes for the upkeep of the sidewalks, why should not the "outlanders" pay for the wear they impose on them? Why should non-residents be exempt? Give them a taste of "Jersey justice." Governor Fort! They wear out the sidewalks. Children under 16 years, $1 per year; persons over 16 and under 25 years, $5; over 25, $10—that's a proper tariff! Think of the glorious opportunity—of the large, elegant sum it would add to New Jersey's income, Mr. Frelinghuysen: Soak it to 'em! They're easy.

Value of Engineering Departments.

It is difficult to form an adequate opinion as to the amount of research and experimental work which is legitimately connected with the production of a thoroughly high grade and reliable motor car. Many of the smaller makers totally underestimate it, as is plain to see. Some few makers, on the other hand, have an exagerated notion of the intrinsic value of their experimental departments which is costing them very dear. The status of the experimental department is then, wholly unsettled in the industry at the present time.

Even without the intent of producing a striking amount of novelty with each new model, the amount of plant which is actually required in order to prove the materials of construction and test out the product step by step and in its assembled form is far and away beyond the comprehension of the mere man in the street, as it is to many of the less advanced producers themselves. As is the case with other non-productive departments of the factory, its utility is no more apparent to the casual observer than its effect is visible to the naked eye. It is only by comparing the outputs of factories where such departments exist in their best form, with those of others in which they do not exist, or if so, only in a limited way, that the real benefit which they carry becomes appreciable. Even then, the difference is more apt to be credited to system rather than to its rightful cause.

From the manufacturer's standpoint it is an open question how much of the capital of the plant properly may be tied up in testing apparatus and outlaid in testing operations. Obviously the economic policy becomes unwise just so soon as it begins to encroach upon the standard quality of the product. The cost of testing cars and parts is really a fixed charge. It cannot be too high so long as its effect is traceable in the output and sales.

The cost of developing new ideas is even more difficult to regulate wisely. There is always the tantalizing possibility of untold wealth hanging about the vague and promising new idea, which tempts to the sinking of profits in experiments, experts' salaries, and commercial ventures not wholly warranted by business sense. Certainly design must not be permitted to stagnate so long as direct and evident improvement is possible. Yet progress demands a constant attitude of quest for improvement. The difficulty is to distinguish between the probable paying or non-paying quality of the proposed improvement as well as of its initial cost.

Some clamor loudly for the "engineering era" in automobile design and construction. No regime imaginable could be more acceptable than one under which cars should be built with sufficient approximation to engineering principle to stand up for a reasonable length of time, even under severe useage. But it must be understood that industrial stability demands that henceforth the engineering department shall pay its way, A close balance must be struck between the paying and non-paying qualities of these expensive and essential, though non-productive elements of the producing mechanism.

COMING EVENTS

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 2-8, San Francisco, Cal.—California Woman's Automobile Club's show in Coliseum.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

March 15-April 1, Omaha, Neb.—Omaha Automobile Dealers' Association's annual show in the Auditorium.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

March 18-24, New Haven, Conn.—New Haven Automobile Dealers' Association's show in Music Hall.

March 18-25, Rochester, N. Y.—Rochester Automobile Club's show in new Convention hall.

March 23-28, Indianapolis, Ind.—Indianapolis Automobile Dealers' Association's show week.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

April 24, Westchester County, N. Y.—Briarcliff trophy race for stock cars.

ECONOMY RUN ON FROZEN ROADS

Twenty-three Participants in Long Island Contest—More Than Half "Economized" on Running Time.

Twenty-three cars competed in the economy test on Tuesday last, 25th inst., promoted by the Long Island Automobile Club. All but four finished the 242 miles run over frozen Long Island roads, which was a much better showing than had been looked for. Just who won the contest is not known, as the technical committee of the Long Island Club will not have the results figured for several days.

The event of Tuesday was supposed to have been an economy test, but only about half of the contestants gave serious thought to the amount of gasolene and oil they used. The others were either too cold or too anxious to "hit it up." As official checking in could not, by the rules, begin until 9 p. m., and as thirteen of the cars that finished checked in before that time, it will easily be seen what is meant.

The start was made from the Long Island Automobile Club's house, at 360 Cumberland avenue, Brooklyn, beginning at 6 a. m., the cars being dispatched at one minute intervals according to horsepower The route took them to Babylon, Southampton, Patchogue, and Amagansett, instead of to Montauk Point, as first intended.

The first car to be put out of commission was W. E. Shuttleworth's Haynes, which retired east of Patchogue. The Hol-Tan, driven by V. A. Neilson, got into difficulties at Sayville, on the return trip. A strut rod gave way, allowing the axle to sag, and the driving gears to bind, the friction eventually heating the parts and twisting off the driving shaft.

The mishap which put David Mahoney (Lozier) out of the running on the outward leg was peculiar and regretable. A team with a stupid driver, woman and child as freight, unexpectedly turned across the road leading from Southampton toward Amagansett. It was a case of either running

R A. VAIL (FRANKLIN) AND OTHER CONTENDERS HALTED FOR LUNCH

Digitized by Google

head on into the entire outfit or turning sharply into the bank, and Mahoney took the latter course. The result was that both left wheels were smashed when the car struck the bank.

The other car which failed to report was the Buick, driven by Hugh Gibson. It broke a wheel at a point three miles east of Patchogue, and a new wheel could not be secured in time to reach Brooklyn within the specified time limit. Punctures were frequent, Charles A. Carlson (Winton) having suffered seven.

The cars arrived at the finish in Brooklyn from 4 o'clock in the afternoon until half-past ten at night, the last one reporting being the little single cylinder Cadillac of James D. Rourk. This car would not have been the last had it not slipped a wheel, which let the axle down to the ground. When new bearings had been secured the run to Amagansett was resumed with success.

As stated before, the committee has not announced the awards, but the cars finished in the following order:

W. A. Flinn, Acme; W. A. Bowers, Thomas-Detroit; Kingsley Swan, Stevens-Duryea; C. G. Arnold, Pope-Hartford; H. Michenor, Lozier; Robert Morton, Pullman, J. W. Mears, Acme; W. Walton, Acme; W. Birdsall, Mora; John Holm, Studebaker; Philip Hines, Pope Hartford; H. K. Knepper, Freyer Miller; D. C. Teeter, Rambler; R. A. Vail, Franklin; C. A. Carlson, Winton; I. C. Kirkham, Maxwell; C. Hosley, Maxwell; H. A. Martin, American Mors, and James D. Rourk, Cadillac.

The awards will be made on the basis of cost per passenger, including operator and observer, for fuel and lubricant consumed. Gasolene is charged at the rate of 25 cents per gallon, and lubricating oil at $1 per gallon. No penalizations were made for repairs, replacements of adjustments to a car or equipment. The first award will be a trophy costing not less than $200; second prize a trophy valued at $100, and third prize, one costing not less than $50.

There were four controls—at Babylon, Southampton, Patchogue and Amagansett, one hour being allowed for luncheon.

Milwaukee Postpones Its Contest.

The three day reliability run of the Milwaukee Automobile Trade Association, planned for Wednesday, Thursday and Friday of this week, has been postponed until next month, and will occur between March 10 and 25. This action was made necessary because of the impossibility of some of the roads to be traversed on the route selected The committee has provided for three classes, as follows: Class A, 1907 or 1908 stock touring cars, runabouts or roadsters, costing $3,000 or over; Class B, 1907 or 1908 stock touring cars, runabouts or roadsters, costing from $1,800 to $3,000; Class C. 1907 or 1908 stock touring cars, runabouts or roadsters, costing $1,800 or under.

Endurance Run with Sealed Bonnets.

The Harrisburg (Pa.) Automobile Club has decided to make its endurance run on May 4 and 5 a sealed bonnet contest as well, and R. H. Johnston of New York has been asked to act as referee. The route will be from Harrisburg through Lebanon, Reading, Allentown and Easton to Philadelphia, the first day. The return journey will be made by way of Norristown, Reading, Lancaster, Marietta, Mount Joy and Middletown, to Harrisburg. Four classes have been provided for as follows: Touring cars costing $2,250 and over; touring cars costing under $2,250; runabouts costing $2,000 and over, and runabouts costing under $2,000. All working parts will be sealed and a technical committee will examine the cars for mechanical defects at the conclusion of the run.

French Garage Regulations Revised.

A new set of garage regulations has just been issued by the French Chambre Syndicale d'Automobile which fixes the charges for garaging of cars at rates representing about a 50 per cent. increase over the former schedule. The storage and washing charges per month vary with the length of the vehicle. For a car up to 9 feet 9 inches in length, the storage charge is something like $7.50, and the cleaning is rated at $10. From this the charges increase proportionately to $12 for storage and $13.50 in round numbers, for washing. The daily charge for storage alone is 75 cents, while in the event of the chauffeur cleaning his own machine, a charge of about $2 a month is made for the water used.

Alcohol Fuel Test for Motor Cabs.

An alcohol fuel test for motor cabs, is to be one of the features of the industrial vehicle trials to be held under the auspices of the Automobile Club of France in May next. Competing vehicles will be divided into classifications according to the number of cylinders carried by their motors, and their bore, the basis being the single cylinder motor with a limiting bore of 100 mm., while the maximum size for four cylinder motors will be 80 mm. The weights must bear a certain relation to engine capacity as well, 1,000 kilograms being the limiting weight for the single cylinder cars having engines of less than 100 mm. bore. The rules provide for a maximum speed of 30 kilometres per hour, and place a restriction on the number of spare tires which may be employed during the trials. After a series of preliminary daily runs, the successful vehicles will be subjected to a final test which will be run on a kilometre-ton basis.

I. C. KIRKHAM (MAXWELL)

D. C. TEETER (RAMBLER)

Savannah Declares Holiday for Racing.

The Common Council of the city of Savannah has passed a special ordinance declaring March 18 and 19, the dates of the stock car races in that city, to be special holidays, and this has been followed by a proclamation from Mayor Tiedeman to the same effect. As a result, the city's institutions, trade and banking organizations will be closed on those days, and the people generally will forsake business to go to the races.

"RACERS" RESTING IN CHICAGO

American Car Leads the Way, After Strenuous Struggle Through Snow—Horses Play Important Parts.

Although an Arctic explorer predicted that if the contestants in the so-called New York-Paris race ever succeeded in getting to Alaska the contest would develop into a struggle between them to see who could procure the most dogs in the shortest period of time, dismantle the car and load it on sleds to be pulled by the canines, reports from snowbound Indiana show that it already has developed into a call for horses instead of dogs. Whichever of the five contestants can secure the most horses and the largest crews of rural snow shovelers is the one that makes the greatest headway.

"This is no race," wires Bourcier St. Chaffray, of the DeDion outfit, to the New York newspaper promoting the American end of the affair, and the Frenchman seems to have guessed right the very first time. It is an endurance contest but not in the accepted sense; it is more of a combination horse-pulling and snow-shovelling contest.

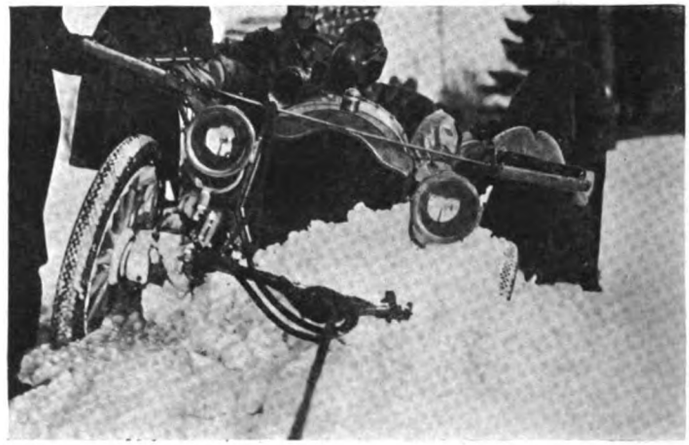
Chicago, 1,043 miles from New York, was reached by the leading Thomas car, Tuesday afternoon. The French DeDion and the Italian Zust had progressed as far as Michigan City, 987 miles, while the German Prothos was last reported at Ligonier, Ind., 912 miles. The Motobloc, the other French car, had gotten to Kendallville, Ind., Tuesday, and at last reports was still going on.

Roberts, in the Thomas car, has had a terrible time of it in the last week. Since he left Kendallville, Ind., six days ago, he has covered only 152 miles, an average of 25 1-3 miles per day. Much of this distance was accomplished with the aid of horses and large crews of snow shovelers, while more of the ground has been covered on rural trolley tracks, which necessitated much bumping over railroad ties and trestles. In that time his longest day's run was on Thursday, from Burdick, Ind., to Chicago, 47 miles. The day before only 9 miles were covered, from Michigan City to Burdick, and this distance was literally dug and pulled through yard by yard.

Roberts's experience has been the experience of the others. The cars have had to be pulled through anywhere from two to twelve feet of snow in Indiana and the farmers are reaping a harvest. According to the correspondent in the Thomas car it has cost $800 to cover the 64 miles between South Bend and Hobart, while the mile and one-half of snow drift near Burdick station, reached at 7 a. m. Tuesday, cost the Thomas outfit $95. This went to the farmers for digging the car out of the drifts and using their horses to pull it through the smaller ones. All the other drivers report similar experiences.

It was a relief to Roberts and his fatigued crew when they sighted Chicago on Tuesday afternoon. In the fourteen days since his departure he has lost twenty pounds in weight; he looked it when he reached Chicago. Part of the last day into Chicago was covered on the tracks of the Lake Shore and the Elgin, Joliet and Eastern railroads. As Chicago was entered ten cars from the Chicago Automobile Club met the Thomas car and escorted it to the club house, where the crew got their first real rest since leaving Buffalo. The Thomas car will be thoroughly overhauled in Chicago and will not leave before this morning (Thursday).

Although Roberts has had a strenuous time in leading the way to Chicago the foreigners have had just as hard a trial in



WHEN REAL HORSEPOWER WAS APPLIED

"BUMPING IT" OVER THE CROSS TIES

ROBERTS CHARGING THROUGH THE INDIANA SNOW

WHEN SHOVELS AND HORSES AGAIN BECAME NECESSARY

Digitized by Google

their rear chase after the American car. If Roberts and his crew were tired when they reached Chicago, the foreigners are practically "all in." Maas and Knape, on the German car, are about used up and Lieutenant Koeppen, the other member of the German party, has gone on to Chicago by train to arrange for extra tires and parts so the car will not be delayed when it reaches the Windy City.

As was expected the French DeDion and Italian Zust cars reached Chicago last night (Wednesday). The Thomas crew spent the day resting in Chicago, and the Frenchmen and Italians will remain to-day and are expected to leave with the Thomas car to-morrow.

The entry of the DeDion and Zust into Chicago afforded some excitement, as it prompted a good natured race between the two cars. Nearly one hundred cars acted as escort and a brass band helped make some enthusiasm, although it could not be stopped from playing "We Won't Get Home Till Morning!" It wasn't the case for the Zust beat the DeDion to the club house by just one miute,arriving at 6.32 p. m., after which banquets were in order.

The German Prothos car was reported at 3 p. m. yesterday at Elkhart, Ind., having covered 932 miles, while the Motobloc was at Goshen, Ind., at 5 p. m.

Probably the most disagreeable incident of the contest occurred on Tuesday night, when the Motobloc car was looted of its entire outfit, according to a dispatch from Charles Godard, its commander. It may have been the sight of two cases of champagne strapped to the car which prompted the loot, but anyway, according to Godard, the car was left in a barn at Goshen, Ind., over night. When he examined the car the next morning it had been stripped of every thing, including the champagne cameras, films, guns, tools, ammunition, supplies, clothes and even the crew's extra changes of linen. Godard states that the authorities refused to aid them in any way and that their inability to speak English perfectly caused the police to regard them with suspicion. They proceeded without having found a trace of the thieves.

What has become of the "independent" which left New York a day before the "regular," by a different route, but also bound for Paris, no one knows or seems to care. The three men on the car had a squabble between themselves when they got to Philadelphia, and one of them, LeLouvier, got his dander up and went back to Paris. The others continued but have not been heard from since.

Larned Launches Its Club.

Fifteen automobilists of Larned, Kan., have formed the Larned Automobile Club with these officers: President, D. A. Ely; vice-president, E. T. Eggleston; secretary-treasurer, R. H. Moffett; executive committee, J. H. Boisseau, A. A. Doerr and Dr. Dillon.

MIDWINTER ENDURANCE RUN EASY

Fourteen out of Twenty Starters in Bay State Contest Made Perfect Scores—Three Failed to Finish.

Beneath skies that were a reminder of June, but over roads that showed earmarks of winter, twenty cars rolled 135 miles on a triangular course from Boston to Providence, Worcester and return last Saturday, 22d inst., in the annual mid-winter endurance run promoted by the Bay State Automobile Association. The test was easy, for of the twenty cars that started, fourteen finished with perfect scores, three had a small number of points against them for minor reasons, while three were considered withdrawn because they did not report at the finish.

It was just one minute after seven o'clock when Frank Wing, in the Marmon, got the word to start, and at one minute intervals the remaining nineteen left Commonwealth avenue, Boston, headed for Providence. Walpole was the first checking station and all the cars reached there on time and in good order. From Walpole the route led through Attleboro and Pawtucket to Providence, which was due to be reached at 9.40 a. m. Up to this point the roads had been in very good condition and all the contestants, with the exception of Robbins (Springfield), reached there on time. The drivers were allowed to replenish gasolene, oil and water tanks at Providence.

It became evident that the schedule was too easy, so ten minutes was cut off the run from Providence to Uxbridge. This was considered the hardest part of the trip, the deep frozen ruts causing many tired arms. All managed to get through, however, except Dennison, in the Knox, who stopped near Uxbridge. At Woonsocket the endurancers got their first ovation. Crowds four and five deep lined the sidewalks.

The schedule time was further reduced from Uxbridge to Worcester, where the dinner stop was made, and from the latter place to Boston. The intermediate checking station was at the Wayside Inn, in Sudbury, Mass., famous as the scene of that story telling bout described by the poet Lonkfellow in his collection of "Tales of a Wayside Inn."

When the cars reached Boston they were taken to the big White garage where they were given over to the technical committee, which, after considerable deliberation decided that fourteen cars were entitled to first class certificates for having made perfect scores. The three cars that were penalized were V. A. Charles's Rambler, which lost four points because a needle point was adjusted; Oliver Light's Thomas Detroit, five points on account of a stalled engine, and J. W. Robinson's Stevens-Duryea, which had eight points charged against it for repairing a broken fan belt.

The summary follows:

Walter Jones, Studebaker	Perfect
Frank Wing, Marmon	Perfect
C. E. Whitten, Thomas Detroit	Perfect
J. Ruggles, Atlas	Perfect
William Bourque, Knox	Perfect
Walter White, White	Perfect
Hal K. Sheridan, White	Perfect
A. H. Dorsey, Thomas Flyer	Perfect
Fred Pratt, Reo	Perfect
J. C. Kennedy, Austin	Perfect
J. H. Hobson, Oldsmobile	Perfect
E. W. Williams, Rambler	Perfect
Theodore Young, Franklin	Perfect
Harry Minchenor, Lozier	Perfect
V. A. Charles, Rambler	4 Points
Oliver Light, Thomas-Detroit	5 Points
J. W. Robinson, Stev.-Duryea	8 Points
L. Robbins, Springfield	Withdrawn
A. E. Dennison, Knox	Withdrawn
L. B. Harris, Winton	Withdrawn

Despatch Carriers Make Good Progress.

Starting six days after the cars in the so-called New York to Paris race, the 30 horsepower Studebaker car, which is carrying a message from General Frederick D. Grant, of Governor's Island, N. Y., to the commanding officer at Fort Leavenworth, Kan., in an attempt to prove the value of the automobile in carrying dispatches between army posts, reached Chicago on Tuesday, five minutes in advance of the leading car in the around-the-world snow-shovelling contest. The car left New York City on Tuesday, 18th inst., and reached Albany, 150 miles, at 11:15 o'clock that night. At 10 o'clock the next morning it was reported at Fayetteville, and at Auburn, 325 miles, at 4 o'clock that afternoon. Thursday morning the car rolled into Rochester, 396 miles, after being held up in a snowdrift all night. Erie, Pa., was reached Thursday night and Cleveland at 4:21 a. m. Friday. William Walls and Charles Hammond alternated at the steering wheel, driving night and day, which explains how the car made such astonishing mileage through snowdrifts which baffled the heavily laden New York-Paris contestants. These cars were passed one by one, the last one being overtaken at Hobart, Ind., twenty miles from Chicago. The latter city was reached at 4:20 p. m. Tuesday, 24th inst. The Studebaker car, by the way, is using chains on the wheels but is fitted with the Continental anti-skid red rubber tires.

Ohio Non-Stop Test Still Continues.

At last accounts, the Franklin non-stop and mileage test which was undertaken on February 11 by the Sid Black Automobile Co., the Franklin agents in Cincinnati, was still progressing without interruption, the odometer registering more than 2,500 miles. Four expert drivers are employed, alternating every six hours, and being accompanied by two observers. The 28 horsepower car employed has encountered some villainous roads and equally vile weather, but so far has run without hitch or skip.

THREE MAYORS AT NEWARK SHOW

Brilliant Opening of New Jersey's First Annual Automobile Exhibition—Representative List of Cars Staged.

With congratulations from the mayors of three cities and in the presence of several thousand people, the first annual show of the New Jersey Automobile and Motor Club and the New Jersey Automobile Trade Association was launched at Electric Park, Newark, last Friday night, 21st inst. Mayor Jacob Haussling, of Newark, officially opened the show and took occasion to compliment the local motorists upon the splendid result of their first endeavor. The other two mayors who lent official dignity to the opening night were Isaac Shoenthal of Orange, and William Cardwell of East Orange.

Newark possesses few buildings with floor space sufficient to hold a moderate sized automobile show, and this fact was apparent on Friday night, and on Washington's Birthday, when the small Electric Park Auditorium was fairly packed.

White and yellow bunting in alternate stripes have been used to drape the ceiling, and strips of the same material have been carried down to within ten feet or so of the floor on each side of the oblong room. At the end of the main aisle furthest from the entrance is a large electric sign with the words "Automobile Show" flanked on either side by heroic size gilded eagles, behind which are festooned flags of all nations. Clusters of American flags on poles are hung every few feet apart along the sides of the hall, fastened to the pillars on each side of the automobile show spaces, which are divided by the main aisle down the center of the hall and by two small aisles near the walls. The accessories exhibitors have been placed along each side wall and the moving picture entertainment, without which no local show would be complete, has been located in a balcony just inside the building.

GENERAL VIEW OF THE AUTOMOBILE SHOW IN ELECTRIC PARK AUDITORIUM, NEWARK, N. J.

Thirty-three different makes of cars are shown, and twenty-two accessory exhibitors display their wares, the full list of exhibitors being as follows:

Greene Motor Car Co., Oldsmobile, Locomobile and Pope-Waverly; Calvert-Zusi Auto Co., Winton; Hygrade Motor Car Co., Ford; Motor Car Co. of New Jersey, Autocar, Northern, Cadillac and Packard; W. S. Maltbie, Corbin; J. W. Mason, Stoddard-Dayton and Maxwell; Mitchell Motor Car Co., Mitchell; Carl H. Page Co., Peerless, Ellis Motor Car Co., Pierce and Knox; Star Motor Co., Pullman and Napier; F. E. Boland Motor Co., National; Brush-McLaren Co., Brush; Rickey Machine Co., Marmon; Sheldon W. Case, Holsman; Allen-Kingston Motor Car Co., Allen-Kingston; Charles S. Cooper, Atlas; Essex Automobile Co., Jackson; Garford Motor Car Co., Garford; J. H. Johnston & Co., Grout and Cameron, H. J. Kochler, Buick and Waltham; A. G. Spalding & Bros., Stevens-Duryea; the White Co., White.

H. T. Alexander & Co., American Auto Rim Co., Auto Tire Repair Co., Brick Church Auto Supply Co., Century Optical Co., Electrical Maintenance & Repair Co., Ellis Motor Car Co., Electric Motor Equipment Co., George A Haws, Adolph Karl & Co., Lovell-McConnell Mfg. Co., National Oil & Supply Co., Newark Garage & Repair Co., Newmastic Tire Co., New York Auto Top & Supply Co., Oriental Rubber Co., W. S. Sheppard, C. F. Splitdorf, Standard Oil Co., Tea Tray Co., O. W. Young, and Louis J. Wurth.

PRIVATE GARAGE CONSTRUCTION

Some of the Problems Involved—Suggestions by an Architect Concerning Dimensions and Essential Features.

As the number of private garages or motor houses increases, it becomes apparent that the construction of these small repositories is quite as much of a problem as that involved in the evolution of the larger structures which are intended to house a great number of vehicles. One of the particular embarrassments is the fact that the house made to fit one car, may be too small to accommodate its successor, while the requirements of a really suitable structure of this sort, forbid it from being made readily extensible if absolute permanence is desired.

In this connection an outline of the more essential requirements of the garage, embodied in a paper read before the British Architectural Association recently, by C. Harrison Townsend affords an interesting and concise summary. As he indicates, the starting point of the garage problem is the area required to store the car, and the amount of head room it is likely to need. The possible replacement of the car by a larger one, must be considered, while possible changes in design of all machines, such as have been responsible for the enlargement of a garage elevator three successive times, in one case which he instances, also must be allowed for.

The following table gives the general overall dimensions of the different models produced by a single large manufacturer, and reveals the amount of difference existing between the volumetric requirements of different machines:

Type.	Wheel Base. ft. in.	Length. ft. in.	Width. ft. in.	Height. ft. in.
14-16 Horsepower.				
Side entrance	8 4	12 6	5 2	5 3
" " (hood up)	8 4	12 6	5 2	7 5
" " (hood folded)	8 4	13 6	5 2	5 6
Single landaulette	9 0	13 0	5 2	7 0
Limousine	9 0	13 0	5 2	7 0
City carriage	6 10	10 8	5 5	7 4
16-20 Horsepower.				
Side entrance	9 0	13 0	5 3	5 5
" " (hood up)	9 0	13 0	5 3	7 7
" " (hood folded)	9 0	14 0	5 3	5 8
Seven-seater side entrance	9 9	13 10	5 3	5 5
Three-quarter landaulette	9 9	13 10	5 3	7 7
Limousine	9 9	13 10	5 3	7 7
26-30 Horsepower.				
Side entrance	9 3	13 4	5 7	5 5
" " (hood up)	9 3	13 4	5 7	7 7
" " (hood folded)	9 3	14 4	5 7	5 8
Three-quarter landaulette	10 0	14 1	5 5	7 8
Limousine	10 0	14 1	5 7	7 8
40 Horsepower.				
Side entrance	9 8	13 8	6 0	5 6
" " (hood up)	9 8	13 8	6 0	7 8
" " (hood folded)	9 8	14 8	6 0	5 9
Seven-seater side entrance	10 4	14 4	6 0	5 6
Three-quarter landaulette	10 4	14 4	6 0	7 8
Limousine	10 4	14 4	6 0	7 8

N. B.—In some cases the head lamps mean a further increase in length.

"For giving the car proper attention space should be arranged between it and the walls at each side and at each end," says the authority in question. "This should be at least 2 feet 6 inches where a pit is provided, but if the latter does not exist, and the car is raised for underwork, the space should be 3 feet 3 inches. In the case of several cars standing side by side, there need only be 2 feet 6 inches or 3 feet between them. So far, then, we have reached the internal size of a one-car house 16 feet + 2 feet 6 inches, or 3 feet 3 inches + 2 feet 6 inches or 3 feet 3 inches = 21 feet or 22 feet 6 inches for the length, and 6 feet + 2 feet 6 inches or 3 feet 3 inches + 2 feet 6 inches or 3 feet 3 inches = 11 feet or 12 feet 6 inches as the width.

"The height of the doors should be sufficient to pass in a car with the hood up, plus its luggage rail, and, possibly, tires on the roof, or, say, 9 feet. They should be at least 8 feet wide in the clear, and may be either steel revolving shutters or they may be hinged—opening outwards, of course—and preferably under a pent roof. Finally, sliding doors may be employed—sometimes the most difficult arrangement to provide for. . . . .

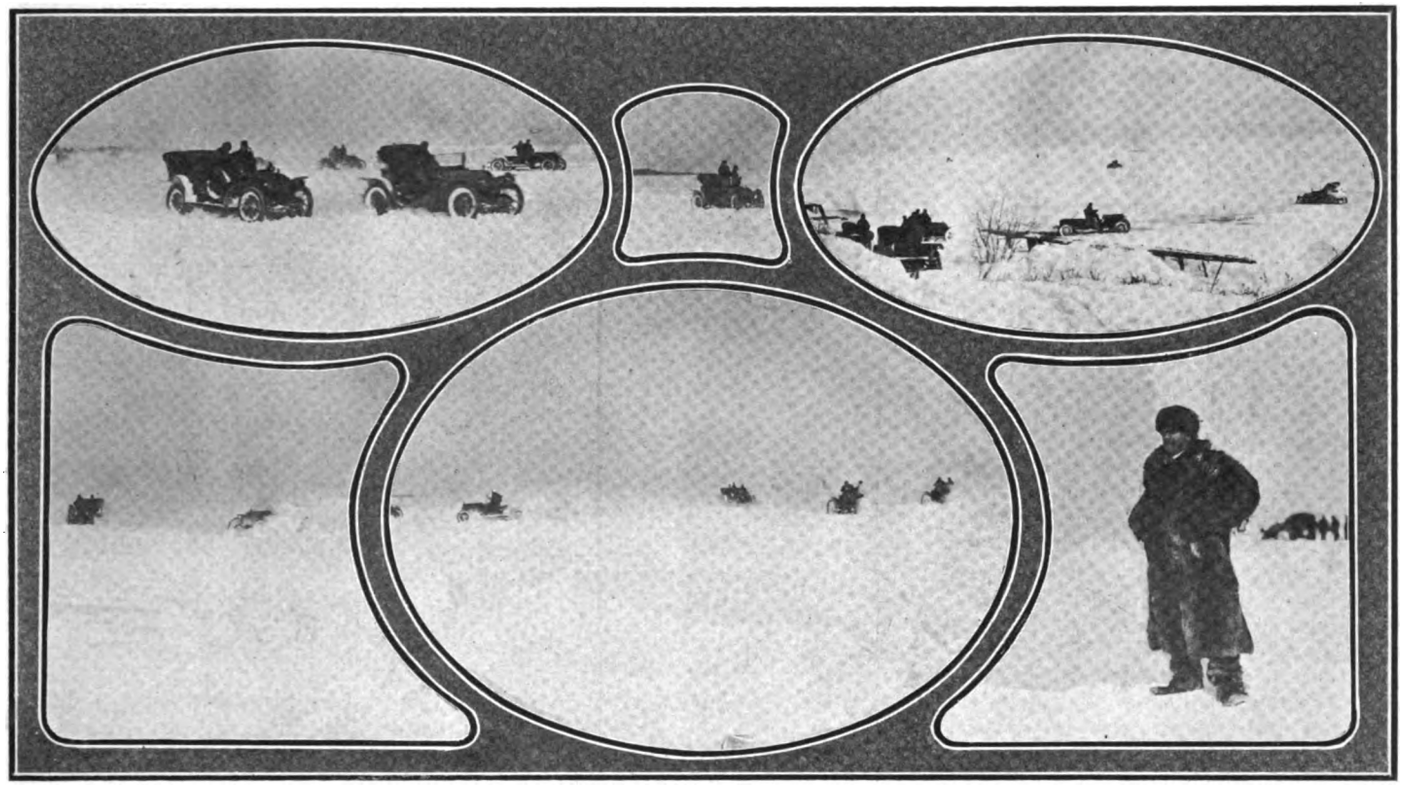
"The walls should either be faced—at all events, to a height of about 4 feet from the ground—with glazed bricks, or lined with tiles. They should have a coved brick or tile at their junction with the floor, to avoid the harboring of grease and dirt. All angles to recesses—such as that for the hydrant or the radiators—should be rounded, and there should be as few projecting features as possible. Just above the floor level in each external wall should be inserted air gratings. They should, where possible, be placed behind the small radiators.

"In the large number of garages cement is laid to a smooth finish and to falls. I do not, however, think this a very efficient material. The action of the dropped oil on its surface tends to rot and 'take the virtue' out of the cement, and granolithic distinctly offers less opportunity for this. Stone flags, laid not on a concrete bed but on sleeper walls for the advantage of the air space beneath thus obtained, seem to add still further to the risk of the dangerous sparks that may result from the car coming in or going out with a chain or stud anti-skid appliance fixed on the tires. Again, unless, the space beneath is of considerable size—a cellar, in fact—there would be the danger of its forming a chamber where explosive gas could collect as the result of leakage.

"The drains should not be underground pipes, but should consist of open, half-round channels.

"In cases where it is incumbent to make use of the pit, the best size for this is 6 feet by 3 feet by 4 feet 6 inches or 4 feet 9 inches deep. Its sides should be lined either with glazed bricks or tiles, and it will be found convenient to form in them a recess on each side in which the chauffeur when at work can place his tools from time to time. Iron ring steps afford access to it. An American expert strongly advocates the extension of the pit beyond the outer wall of the garage, as tending towards a certain amount of ventilation at all events, as giving means of escape for the chauffeur, who would otherwise be shut up in a trap in case of fire. . . . .

"It is of importance that there should be no risk of the temperature of the motor house falling to freezing point. As regards, however, the heating and consequent drying of the atmosphere of the motor house, there are two conflicting claims to be satisfied. Expert carriage builders plead on behalf of the painted body and wheels for a house 'which cannot be too dry'; while Dr. C. O. Weber, the authority as far as rubber is concerned, states that tires are likely to 'keep distinctly better in a damp that a dry room.' Keeping a balance between these two claims we find that the motor house is best when dry, but not unduly so. Its temperature should be about 60 degrees F. The heating apparatus, of course, should have no opening from the motor house, but be arranged with external access, and a low pressure system with radiators will be found the best. These may be placed as found advisable, but in a garage of any size there will be a considerable advantage if a cupboard be provided containing a small radiator, to be made use of when drying rugs or cushions, and with ventilation to allow the escape of the resultant steam. . . .



"The storage place for tires, testing apparatus, pumps and spares generally," he says, "should be distinct from that in which cloths, cleaning oil, brushes, waste, etc., are kept on metal-covered shelves, and with proper ventilation. There should be rack accommodation for rugs, extra cushions and the like."

SPORT ON A CRYSTAL MOTORDROME

Frozen Lake Utilized for Packard Tests and Experiments—Fun with a Practical End in View.

The cold winds of winter having served to coat with thick ice the water of Lake St. Claire, in Michigan, it occurred to the fertile mind of the Packard management that right at hand was a perfect course over

PACKARD TESTS AND EXPERIMENTS ON THE FROZEN SURFACE OF LAKE ST. CLAIRE—GENERAL MANAGER JOY LOOKING ON

which to drive their cars in a series of tests and experiments as conclusive in their results as would be obtained by many miles of summer driving, and with far more of real sport and specularity.

As a result for several weeks the testers of the Packard Motor Car Co. have been taking advantage of the opportunities for testing cars offered by the snow covered ice on the lake and each day there have been a dozen automobiles racing and chasing through the snow drifts, and up and down the snow shrouded banks, making the snow fly in picturesque fashion, as the accompanying illustrations serve to show.

To the Packard people the opportunity for fast driving on the ice appeared as somewhat of the nature of sport rather than work, and since the last heavy snow storm the administration, engineering and testing departments have been busy for days driving cars through the snow clogged thoroughfares leading out of Detroit, and engaging in races on the frozen lake without thought or fear of police interference, even General Manager Joy himself having been unable to resist the temptation.

Remedy for Leaky Radiators.

Edwin F. Field, of Auburn, Me., has "discovered" a panacea for leaky radiators, which is claimed to be the long-lost and much-sought-for boiler sealing compound, the lack of which was responsible for so many heavy repair bills in the halcyon days of the teakettle boiler. In fact, Mr. Field's discovery is the result of many years of experiment with boilers of this type. Though intended primarily for sealing a leaky boiler, however, the remedy is equally applicable to radiators which lack the essential watertight feature. The medicine consists of a black powder of secret composition which, when dumped into the offending boiler or radiator at once finds its way to the affected part, stopping up the hole or holes by a sudden and silent process and leaving behind it a permanent repair, affecting only the injured locality.

Coasting Over Sharp Gravel.

It is of small consequence whether a patch of loose and sharp gravel in the road is taken at high or low speed, so far as wear on the tires is concerned, so long as the clutch is released during the interval and the car is permitted to "coast." When the wheels are relieved of the traction strain, nothing more is to be gained by running slowly than by running fast, so long as sufficient steerage way is maintained, and not sufficient speed attained to cause skidding.

TROUBLE THAT WAS MYSTIFYING

Its Source was Unsuspected Because it was Unusual—An Old Timer's Narrative of a Curious Experience.

"One of the hardest problems I ever encountered in the way of ignition trouble," said the motorist who is qualified to pass as an old timer, "was presented to me one afternoon when I was taking a trial spin in a car that had just been overhauled. It was a one cylinder runabout, and as I had owned and driven it for several months I was entirely familiar with every piece in its make-up, and I believed that nothing but a broken part or a burned out coil could give me more than a few few minutes of trouble.

"When I started for my trial ride, on the afternoon in question, I put in a new spark plug; it was one of the type where a wire runs through the mica core and extends out about one-half an inch, its end being bent over like a hook and ending close to a similar wire or sparking terminal that was fastened to the base or shell. Before inserting the plug I tested it and finding that it was all right, I did not attribute the difficulty I had in starting to anything connected with it. After cranking a good deal more than was generally required of me the engine started and I drove away.

"My first trouble came when I began the ascent of a steep hill. The explosions became very irregular with a consequent loss

Digitized by Google

of power. The first thought was batteries, but knowing that they were all right, I looked over the rest of the ignition and found nothing amiss. After a lot of delay I loosened the secondary wire from the plug took the latter out and found that to be all right as I had supposed it would be. Again I cranked the engine and after a little time succeeded in getting it going, but as soon as I tried to move the car the same irregularity of firing was noticeable.

"Well what to do I didn't know. My gasolene was good. My carburetter was working, batteries O. K. I had compression and the spark plug responded to all tests and the machine would not begin to do its work. It was merely a case of 'think it over' and as I am not a person who aimlessly tinkers in the hope of accidentally finding out where the trouble lies, I did not make a half dozen changes in the different parts which were working all right but confined myself to seeking something that was apparently susceptible of change or readjustment. As I could find nothing that was out of order I determined it must be in the spark plug and though that was apparently all right, I replaced it with another, tried results and found I had located and remedied the difficulty.

"Naturally my curiosity was excited and a careful examination of the plug showed that the whole center core was slightly loose and when I tightened the nut holding the secondary wire I turned the core so that the sparking points became too far apart for the spark to jump when the load was on. In taking out the plug I first loosened the nut and in doing this turned the core back to its normal position so that the trouble was not apparent at a casual inspection.

"It was a very unusual thing to have occur and if it ever happens again it will not bother me for any great length of time, but I venture to say that no matter how experienced in gas engine matters a man may be the same perplexity encountered for the first time will make as much trouble for him as it made for me. When a brand new spark plug tests out all right there's mighty little reason for ascribing to it a trouble which might come from some other source."

New Theory of Carbon Deposit.

A foreign investigator has advanced the theory that the use of lubricating oils containing quantities of vegetable or animal oil is responsible for the presence of copper in the cylinder incrustation usually known as "carbon deposit," and in which traces of that metal have recently been discovered abroad. His idea is that the "fatty" acids of the spurious constituent in the oil attacks the brasses of the various bearings forming a small amount of "metallic soap" which finds its way past the piston and into the combustion chamber. The high heat existing during the cycle is then sufficient to decompose it and leave the metal in the crust which the heavier constituents of the oil leave behind.

MAKING PATHS FOR FIRE FIGHTERS

Automobile Performs Pioneer Duty for Detroit Department—Clears the Roadway in Snow Bound Streets.

While the automobile has been put to many uses that are foreign to its general occupation of transporting persons or merchandise it remained for the Cadillac Motor Car Co. to prove its utility as a path maker for the fire department. A few days ago, after a heavy fall of snow in the city of Detroit, Mich., it was feared that the fire department would experience difficulty and delay in responding to an alarm if one should be sounded. At the solicitation of one of the fire companies, whose location is near the Cadillac factory, a 25 horsepower Cadillac was pressed into service and a snow scraper fastened behind it. Although the snow was a foot deep, with occasional drifts much deeper, the car not only was able to break a way for itself, but succeeded in pulling the plow and in clearing a path over about 15 miles of streets, and in not much more than an hour.

CADILLAC BREAKING ROAD FOR DETROIT FIRE FIGHTERS

Indianapolis Show Awaits Freemasons.

Indianapolis dealers have decided to postpone their proposed "open house show week" to March 23-28, instead of one week earlier, as first arranged. Two thousand Masons are expected in Indianapolis during the former week and the dealers are confident that many of the lodge members will ride home in new automobiles. It has been definitely decided to hold a hill climb and a parade during the week, the events for the former being as follows: Cars listed at $1,000 or under; cars listed from $1,000 to $1,800; cars listed from $1,800 to $2,750; cars listed from $2,750 to $3,500, and cars listed over $3,500. A silver loving cup will be the first and only prize in each event.

Portland's Show Simple but Pleasing.

Portland's annual automobile and motorboat show is holding the boards in the Maine seaport this week. The show opened on Monday night in the Auditorium and will continue throughout the week. The decorations are simple but pleasing. Red and white is the general color scheme, the floor being carpeted in green, while thousands of flags hang from the girders. Among the exhibitors are Herbert A. Harmon, Franklin and White; F. A. Nickerson Co., Oldsmobile; Stoughton Folkins, Maxwell; Portland Co., Knox; Spear Auto Co., Ford; L. C. Gilson, Reo, Premier and Stanley; Maine Motor Carriage Co., Stevens-Duryea, Peerless and Pope Hartford; and Swan Stuart, Cadillac. J. H. Dowling, the Thomas agent is not exhibiting at the show, but is holding "open house" at his garage on Forest avenue.

Tire Makers Offer Cash "Accelerators."

If the car driven by the winner of the Briarcliff trophy stock car race on April 24 is equipped with Diamond tires, it means an extra $500 for him, the Diamond Rubber Co. having hung up that purse as an added incentive. For second place they will give $350, and for third, $150. The Diamond corps of tire experts will be on the course, of course, to "lend a hand" when it is necessary.

Similarly the Continental Caoutchouc Co. has offered $200 for victory in the 300 mile race on Ormond Beach next week, and $100 for first place in the 100 miles event.

A. A. A. FRAMES AN AMATEUR RULE

But It Proves of a Very Original Character —Two Cities Apply for Vanderbilt Cup Race.

Three days of last week were spent by the sub-committee of the American Automobile Association's racing board in the work of revising the racing rules, which suggests that many changes were made. The nature and extent of the amendments are, however, official secrets save in one respect: It is authoritatively admitted that the committee heeded the demand for an amateur definition, the rule as drafted for submission to the full board taking the following form:

"A man who has never driven or raced a motor car for pay, either in cash or any other valuable consideration; or competed for a cash prize; who does not make his livelihood or any part of it, as a result of racing or driving, either as a demonstator, tester, or chauffeur; who has not otherwise received financial reward for engaging in competition; who has never been declared a professional by any sport-governing body or who, having been so declared, has been reinstated either by such body or by the racing board of the A. A. A."

All of the members of the sub-committee. Messrs. J. Dumont Thompson, chairman; Alfred Reeves, A. L. Riker and S. A. Miles, were present at the meeting of the board, which was held in the Association's New York offices on Monday last, 24th inst., when they submitted the result of their labors. The others in attendance were William K. Vanderbilt, Jr., New York; E. R. Thomas, Buffalo, N. Y.; Rossiter Worthington, New York; A. R. Pardington, New York; A. G. Batchelder, New York, and Frederick H. Elliott, secretary.

The revised rules were read and discussed and ordered printed. They now will be submitted to the absent members for suggestion. They will come up for final adoption at the next meeting of the board.

The Vanderbilt cup race also had a look up at Monday's meeting, and prospects were held out that it may be run this fall. Chairman Thompson reported that the Automobile Club of St. Louis and the Savannah Automobile Club, both were desirous of submitting propositions for the holding of the Vanderbilt cup race next fall, and Vanderbilt himself requested that the proposals from these clubs be investigated and placed before the board at an early date.

Rough Hewing in Ohio Legislation.

After considerable entangling argument relative to "schofurs," "chaffers," and "shufoors," the Ohio senate has decided that it does not know exactly what is contained in the automobile bill introduced by Senator Ward, and has sent it back to the committee for revision and reprinting. A fight was made for home rule for cities, but not with success. It was agreed that cities might determine what portions were closely built up, thus coming upder the eight mile limit, and the remainder was left at the fifteen mile limit. One senator wanted the annual license fee increased from $2 to $10, but a compromise was reached on $5 per year. A provision put in by the committee preventing chauffeurs from getting a commission on supplies was stricken out as not germane to the bill. Senator West discovered indications of carelessness in drawing the measure which was copied from the New York law, and was full of references to "boroughs" and other features of the New York law not applicable to Ohio. The committee is now at work on the corrections.

May be Maryland Motordrome.

Mimetic Maryland has contracted "autodromstructitis." This is a malady that causes persons to form companies to build mammoth velodromes for automobile racing only, none of which are constructed, however. The fever is is contagious. New Jersey has been the worst sufferer, but New York, Massachusetts, Pennsylvania, Ohio and even diminutive Delaware, have had attacks of it. Now comes Maryland. Senator Gorman has asked the legislature of that State to grant power to the Motorcar Racing Association to construct a motordrome in the State and operate it. Senator James Young, Thomas A. Robinson, E. A. Cassiday are named as backing the project.

A. A. A. Ready to Test Anti-Chain Rule.

If any member of the American Automobile Association is particularly anxious to test the validity of the recently re-enated regulation of the New York Park Board prohibiting automobiles wearing tire chains, it will cost him nothing to do so. All he need do is to notify the office of the Association, 437 Fifth avenue, or Charles Thaddeus Terry, counsel for the American Automobile Association, 100 Broadway, New York, of his arrest, when the association will step in and defend him. In fact the A. A. A. will defend, without expense to those arrested, any number of cases as may be adequate to test the validity of the enactment.

Easter Sunday for Jalisco Cup Race.

According to advices from Guadalajara, Mexico, the annual Jalisco cup race will take place on Easter Sunday, April 19th. It is stated that one of the contestants will be Joseph Tracy, who will drive a 90 horsepower Locomobile. The Jalisco cup race is Mexico's biggest sporting event, the prize being a costly silver cup donated by Alfonso Fernandez Comellera. The Mexican government allows the promoting club to close the roads on the day of the event, besides furnishing abundant troops to police the course. All the business houses of Mexico City declare a holiday during the races.

MOTORISTS CANNOT GET DAMAGES

Roads Need not be Made Safe for Them, Says Massachusetts Court—Automobiles not Carriages.

According to the Supreme Judicial Court of the Commonwealth of Massachusetts an automobile is not a carriage, and despite the fact that they pay special and extra fees ostensibly for highway improvement, it is not part of the authorities' duties to keep the roads safe for automobilists' travel. In other words, the provisions of law which make cities and towns liable for injuries sustained by carriages through defects in the roads do not apply to automobiles.

This wealth of judicial wisdom was evolved in consideration of an appeal made by the town of Ayer from an award made by a local court. William C. Doherty had sued the town for damages on account of damage to his automobile resulting from the condition of the road. Judgment for $100 was given in Doherty's favor, but the award was set aside by the Supreme Court in a decision handed down on the 25th inst., in which Chief Justice Knowlton says:

"It hardly can be contended that locomotive cars of many tons' weight, propelled by gasolene or steam or electric engines, with complicated machinery capable of developing 50 to 75 horsepower and sometimes even more, are vehicles of a general kind as the carriages known to the legislators of Massachusetts in 1786."

This part of the decision was in reference to the highway statute originally enacted in that year requiring cities and towns to keep their roads safe and convenient for "travelers with their horses, teams and carriages."

The court says that to oblige cities and towns to put all highways through remote and seldom used sections into a condition to stand the strain of automobiles would be a burden heavier than they could bear; also, no reasonable expenditure of towns would be enough to make all roads safe and convenient for the use of heavy automobiles at all times of the year.

The court decides that the automobile is not a carriage with the meaning of the statute, and that any one can lawfully ride in them, but that "if the road is reasonably safe for travel generally, towns are not liable for a failure to make special provision required only for the safety and convenience of persons using automobiles or bicycles."

Lytle Changes His "Stable."

Herbert H. Lytle, so long associated with the Pope-Toledo racing "stable," has been engaged to drive an Apperson Jackrabbit in the Savannah stock car races next month. George H. Robertson will drive the other Apperson that is entered.

SCIENCE OF THE ROLLER BEARING

Alden Explains Reason for the Taper Roll with Two Ribs—Its Evolution in the Timken System.

Since the development of the anti-friction type of bearing has become, as it were, an art within an art, it follows that comparatively few engineers are really well informed on all phases of the subject, while the average layman has absolutely no comprehension of the theory involved in the construction of the various types answering to this description, even though the mechanical construction involved may be thoroughly familiar to him. The following paper, which was read by H. W. Alden, consulting engineer of the Timken Roller Bearing Axle Co., at the January meeting of the Society of Automobile Engineers, is therefore particularly informing, as showing in a general way the application of the self-aligning taper roller bearing to the uses of the automobile mechanism.

"There would seem no chance for argument that in the abstract a roll should be capable of carrying a greater load than a ball of the same external physical dimensions, granting that material and workmanship are identical and eliminating the question of alignment of the roll," says Mr. Allen. "Comparisons made in this article will assume a ball bearing using a curved surface for the cone with a radius of .7 the ball diameter. No distinction will be made between the annular or radial, and the so-called bicycle type of ball bearing. In the roller bearing the diameter will be assumed, same as that of the ball with length equal to diameter.

If we consider that, when a ball or roller is loaded, there is an infinitesimal flattening out at the point of contact, then the load-carrying capacity, other things being equal, will be approximately proportional to the area presented to carry the load. We find that assuming the roll or ball and the cone to suffer a deformation of approximately one thousandth of the radius of the ball or roll, we get resulting areas in the ratio of approximately 7½ to 1 for the roll and ball respectively. Now it is this remarkable showing that has tempted so many to experiment with the roller bearing. A search through the patent files of this country alone shows an almost unlimited number of attempts, very few, however, of which have ever come to light, and almost all of which have disappeared from view. Perhaps the majority of experimenters have tried the taper roll, which statement brings us up to our second point, namely, end thrust.

"The cases where a bearing is submitted to side load alone are possibly in the majority, but there are many cases where the bearing has both side and end load to withstand. This is particularly true in the case of the automobile, where perhaps the majority of the bearings have to stand thrusts, some of which, as in the case of wheels and bevel gears, are exceedingly severe. I think we sometimes fail to recognize the severity of this front wheel end thrust. When turning a corner of 25 feet radius at 15 m.p.h., which is by no means rarely done, the end thrust on that front wheel bearing which gets the maximum thrust is just about the same as its legitimate side load. The bearing then ought, by virtue of its design, to be able to take about the same load one way as the other. Now this is a strong point of the taper roller bearing. It can be shown that such a bearing, having an included angle of approximately 23 degrees for the cup, can carry the same end thrust load as side load for a given surface pressure normal to the roll surface. I find that there is a pretty general impression that, in the case of a taper roller bearing, having an abutting shoulder, all of the end thrust load is taken on this small shoulder. This is not the case, as can be shown by a simple illustration. Suppose a complete bearing to be subject to end thrust, but not to be in motion. Now, while the load is still applied, remove the rib or shoulder on the cone, by screwing it back out of the way, for instance, and it will be found that nothing happens. No matter what the load, the rolls refuse to change position. Now rotate the bearing slightly and it will be found that, so long as the rolls remain in correct alignment, there is no axial change in their location. When they get out of alignment, however, they begin to creep back up the cone.

"This brings us to the third point in question, that of alignment. And this, be it said, is the feature of greatest importance in all roller bearings. It is the rock on which many a roller bearing has gone down. In the case of parallel roller bearings, there is a peculiar but persistent tendency of the rollers to work endwise; not great, but still present. Now most parallel roller bearings have some member either on the cone or cup, or both, to limit this action, and sooner or later the roll brings up against this abutment. So also in every taper roller bearing, the rolls bring up with a certain slight pressure against this same limiting element. It is at this crucial point that roller bearing designs and construction diverge. From this point all can be divided into two classes, those receiving this limiting effect at one end of the roll and those receiving it at both ends. Perhaps I should not have referred to the latter class in the plural as there is only one where this effect is obtained, i. e., receiving this limiting action at both ends of the roll. If the roll bears ever so lightly against an abutting shoulder at one end only, the tendency is to exert a slight retarding effect at this point which disturbs the alignment. With the correct alignment gone, there is then not pure rolling action, but a rubbing action, and furthermore the area of contact at once is greatly reduced. In other words, sliding friction has been substituted for rolling friction, and the contact area to carry the load has been reduced. The life of the bearing is therefore greatly reduced. When, however, this slight retarding effect is applied equally to each end of the roll, it is changed from a disturbing action to an actual guiding action.

"When the Timken company first began work on taper rolls, they, like all others before then and some since, had but one rib on the cone, and their earlier experiments were all failures as could have been predicted had the proverbial foresight been as good as 'hindsight.' Upon the introduction, however, of the two ribs, the alignment difficulty disappeared, and some seven years' experience covering many forms of application prove the fundamental value of these two ribs. Another feature of the taper roller bearing which appealed at the outset was the ability to take up wear with this form of bearing. We like to think that wear does not occur with pure rolling contact, but the bulk of the experience of users of bearings shows that in most cases wear does occur. If it cannot be taken up, it continues at an increasingly rapid rate, whereas, if it can be taken up, the bearing is ready to start out fresh again. Doubtless for some service, size and material can be chosen to eliminate wear from practical consideration. These cases are limited, however, and even in such cases a larger amount of material must be used than would be required if some wear could be tolerated. On the whole, then, from a practical standpoint, the taper roller bearing using two ribs has good reason for its existence, because of its area of contact giving large side load capacity; its large inherent and thrust capacity; its insurance of correct alignment, and its adjustability for wear."

Sparks Tell Difference in Steel.

To the average automobile mechanic, all steel is pretty much alike until he attempts to work it either by hand or in the lathe, when he immediately discovers that there is a vast amount of difference between steel and steel. In this connection it is well to remember that the so-called "high speed steel" may be distinguished by its tendency to develop red sparks when pressed against an emery wheel, while the ordinary tool steel gives a shower of white sparks under similar circumstances, as does machine steel.

Short Circuit for the Magneto.

Wherever the magneto is employed in connection with a double ignition system, it is important that the controling switch shall include means of short circuiting the magneto when it is not in use. If this provision is not properly carried out there is danger of breaking down the insulation of the armature windings.

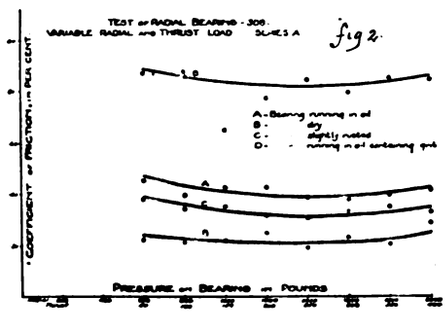
CARE OF THE BALL BEARING

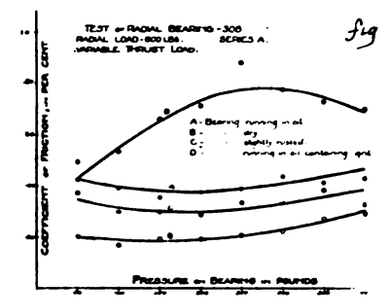
How Lack of Lubrication Affects Its Running—Effects of Rust and Grit as Shown by Tests.

There is a general impression extant among automobile users, that, whatever may be the effect of neglect and misuse upon a bearing of the plain cylindrical type, the average ball bearing may be run without oil, with its parts badly rusted, or even clogged with grit, without seriously affecting its efficiency. This impression is fostered by the fact that even under the most adverse conditions, the ball or roller bearing cannot "set" as may happen with the plain bearing when subjected to abuse. An accurate, and enlightening demonstration of the mistake of supposing that the ball bearing requires no attention, and will run as well under poor as under good conditions,



was supplied by a paper read before the Society of Automobile Engineers recently by Henry Hess.

Taking a bearing of the two-point contact, annular type ordinarily used in wheel hub bearings, several tests were performed with the idea of determining the effects of various running conditions upon it, both normal and abnormal. "In a hub the load will be purely radial, i. e., at right angles to the axle when the car is going straight ahead," says Mr. Hess. "When rounding a curve, or weaving from side to side an end thrust, parallel to the axle, will be imposed in addition. Properly mounted and taken care of, the bearing will be amply lubricated and kept free of rust and grit." Because not all bearings are "properly mounted and taken care of," as well as "amply lubricated and kept free of rust and grit," the tests were made to include such improper conditions as might be assumed to result from improper use.

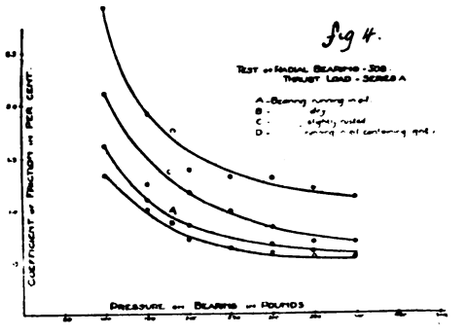


Briefly, four sets of tests were carried out embodying radial loads, combined radial and thrust loads, and thrust loads only. For each of these conditions, four sets of trials were made corresponding to conditions of (A) copious lubrication; (B) practically no lubrication; (C) with rust, and (D) with grit; these tests were repeated under each load condition. The loads ranged from a low load as compared with the capacity of the bearing to a very decided overload. The radial load started at 600 pounds and was raised by 200 pound increments to 2,000 pounds. The thrust loads ranged from 50 pounds to 400 pounds by 50 pound increments. The speed was taken at 300 r.p.m., this corresponding approximately to a car speed of 30 miles per hour.

Copious lubrication was provided by allowing the bearing to dip into a relatively

large reservoir of oil. For dry running the bearing was rinsed out in gasolene and then dried out in an air blast; this left a very slight oil film, not perceptible to the touch, but nevertheless present. After this test the bearing was rusted in water until a light coat was deposited on all surfaces. Owing to the high finish of the balls and races, the rust film on these was not thick; on the separators which are not polished, the rust was much heavier and interfered decidedly with their elastic action. Grit was provided by throwing sharp building sand between the races.

The tests were carried out by means of a special friction measuring machine capable of measuring the force of the frictional resistance due to radial loads up to 15,000 pounds, of thrust loads up to 10,500 pounds, and of combined radial and thrust loads in any ratio within these limits, and at speeds ranging from 200 to 2,000 r. p. m. The accompanying curves were plotted from the



results of the various tests. Of that shown in Fig. 1, the author says:

"The friction (always referred to the bore of the bearing in order to permit of ready comparison with the friction that occurs in plain journals at the bore or shaft surfaces) ranges from 0.21 to 0.25 under copious lubrication (A). The dry running curve (B) is parallel, and, curiously, lies about 10 per cent. lower. The difference represents not the difference in bearing friction, but that of the relative resistance of the copious oil supply and the slight film left after the oil was washed out in gasolene. It would not do to conclude that this justifies the cutting out of oil, as is not infrequently advised; aside from other considerations, oil, and plenty of it, is necessary as a rust preventative.

"Curve C, with the bearing rusted, shows at first about 50 per cent. increase in friction, and then, very surprisingly, a gradual drop, curving down to the best values of A and B; but toward the close rising again sharply. An examination of the races involved shows that the initial higher friction was due to the rust, that, as this was worn off, the friction dropped and that the roughening due to the rust having destroyed the high polish and the truth of the ball and race surfaces was attended by an increasing breakdown of these surfaces, as indicated by the final fast rise of the friction. Prolonged running would undoubtedly have confirmed the road experience of the very serious influence of rust on bearing life and endurance.

"As was to be expected, the insertion of

grit raised the friction very decidedly. The readings varied widely, so that the average curve, D, will be seen to lie quite far from some of the points. As the run was started with the lower loads, and as it took some time to bring about an even distribution of the crudely inserted grit, the friction rose as the grit involved more of the surfaces; the drop after that is accounted for by the gradual working out of the grit and to the grits being worked down and partially destroyed by the wearing action of the balls. In an automobile hub the grit would be more serious since it could not readily escape. The friction due to grit and rust tends to draw the end plates and separators under the balls, and as these two destructive agents wear down the parts the separators may be, and occasionally are, drawn under the balls. That means a destruction of the separators, while the violent wedging also occasionally causes the outer race to be split.

"Fig. 2 gives the friction of the bearing carrying simultaneous radial and thrust loads, increasing simultaneously. A comparison of values under the condition of good lubrication, A, between Figs. 2 and 3, shows that a thrust load of ¼ of the simultaneous radial load about doubles the total frictional resistance, and that, as there is no pronounced upward trend within the load limits advocated, such combined loading is good practice. The curves of Fig. 3

Digitized by Google

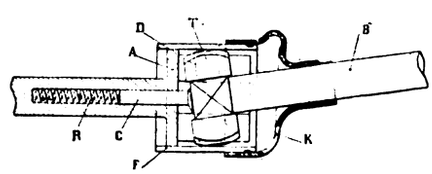
for a constant radial load of 800 pounds, and a variable thrust load of from 50 to 400 pounds, confirm the deductions drawn from Fig. 2. The advisability of submitting this two-point type of radial bearing to thrust loads has been frequently questioned, and occasionally even the admissibility of doing that has been denied.

"Fig. 4, gives a series of curves showing the friction in the conditions, A, B, C, and D. It will be seen that in every case the friction falls with an increasing load. It is generally reasoned that under thrust the balls must wedge between the curve races. Were that true, then the friction should not only be high, but even though not equally high under all loads, certainly not decreasing under increasing loads. The curves bear out my reasoning in explanation. We know, of course, that under load there will be a deformation of the shape of the balls and races, and that the theoretical point contact is actually a surface contact of small area. I assume that this surface has an average inclination which gives a blunter wedge than the geometrical angle of the theoretical point contact. . . . . As the load increases the deformation must increase; an increasing bluntness of the wedge angle with increasing load should therefore be accompanied by a decreasing frictional coefficient. This reasoning is confirmed by the trend of the curves of Fig. 4. Also, it has been observed that the thrust-carrying capacity of the heavy type of radial bearing is relatively less than that of the medium and light types. Now the heavy type has much larger balls and these will consequently deform less under heavy loads; that means a smaller change from the theoretical wedge angle, and, therefore, a relatively greater friction; so that this observed fact may be taken in further confirmation of my reasoning."

Among his conclusions, he presents these important points: "Simultaneous radial and thrust loading is permissible and does not result in a material increase of friction as compared with radial loading only.

"The bearing should be copiously lubricated; easiest running will be had with the least viscous lubricant; that, however, must not be so light as to escape readily, but must be retained by the mechanical arrangement of the hub.

"Rust must be rigidly excluded, as it will result in breakdown of the bearing surfaces and of the carrying capacity.



"Grit must be rigidly excluded, as it will result in a wearing away by grinding of the balls and races.

"As between rust and grit, the former is the more dangerous, since it involves the destruction of carrying capacity, while grit merely brings about a faster wear than is desirable. Rust and grit are nearly always found associated, as the conditions admitting the one generally admit the other. Their combined influence is decidedly bad. Fortunately, both can be kept out by means which are available, simple and cheap."

CUSHIONING THE END THRUST

Simple Method Adopted in Double Jointed Propeller Shaft—Maintains Position of "Floating" Member.

In the construction of the universal jointed propellor shaft of the live axle car, it is, of course, necessary to provide for flexure in the direction of the vehicle's length as well as in the vertical and lateral senses, since it is impossible to maintain an absolutely fixed distance between the axle and the gear box or clutch at all times. On this account it is customary to provide a slip joint of some sort either directly in the cardan joint, or in the shaft itself. In some cases one of the couplings of the cardan joint is made to slide loosely over one end of the shaft, which is squared. In others, the coupling itself is so constructed

that a certain amount of end play is permitted.

In certain instances where a double jointed shaft is employed, two such slip joints are provided, one at either end. In such a case, there is a tendency for the "floating" member of the group to work to one end or the other, thus locating the sliding movement entirely at the opposite end of the shaft. To guard against this tendency an elastic medium, such as a spring or springs, is frequently introduced to preserve the distance of the slidable member from its limits of travel under ordinary circumstances, and maintain the full elasticity of the system.

The arrangement here illustrated is designed to accomplish this, and has been adopted for the 1908 model of a well known foreign car. Because of its simplicity, it well illustrates the purpose it is intended to fulfill, as well as showing the drawback obtaining where no such provision is made. The joint consists of the flanged driving shaft, A, which is slotted to receive the bearings, D, for the trunion, T, which is a part of the driven shaft, B, in which the flexible provision is made. The shaft, A, is drilled out for a short distance, and carries the plunger, C, which rests against the end of the shaft, B, and is backed by the helical spring, R. The joint itself is completely housed by the shell, F, and the flexible protector or boot, K.

From the illustration, it is plain to see that the shaft, B, may approach or recede from the end of the shaft, A, within certain limits, yet without affecting the action of the joint. The same applies to the second joint at the opposite end of the shaft, B, which is similarly mounted. The function of the spring, R, is to keep the shaft equally placed between the two joints, which it does by working against a second and similar spring mounted in the other joint. The effect is to cushion the longitudinal movement of the shaft without in the least affecting its suitability in the main purpose of supplying a supple connection between the motor and the driving axle.

To Make a Flexible Plug Connection.

One of the frequent annoyances that the motorist is subject to is the breaking off of the secondary terminal at the spark plug end. While the main cause of this is the vibration of the wire, a contributing cause may be found in the fact that the terminal is soldered to the wire making a stiff and solid connection at a point where flexibility is desirable.

A simple and thoroughly effective way of obtaining a good contact, and yet securing one that is absolutely flexible, is by coiling a fine brass spring wire, say about an 18 or 20 gauge, around a lead pencil, making a spring 3 or 4 inches long, the end of the coil spring thus obtained may be soldered to the secondary wire and the other end of it either soldered to a terminal or shaped to meet the requirements of the spark plug. The result of this is to obtain a flexible end that will permit of any amount of vibration and will not offer sufficient resistance to cause the wire to break.

To Prevent Trucks from Skidding.

At first thought one is not likely to believe that automobile trucks for heavy delivery, fitted with huge twin tires are apt to cause much trouble from skidding, but when it is realized that, though these ponderous vehicles are designed for slow speed only, they obtain a high rate of speed when going down a hill, the question of some anti-skid devise is of prime importance.

Possibly the simplest and yet most effective preventative that can be obtained is an ordinary chain running around the wheel between the two tires. If it is sufficiently loose so that none of the driving strain comes on it there would be comparatively little wear, but when the car begins to skid because of the sudden application of the brakes or for any other reason, the side movement would bring the chains into play and effectually stop it.

Tire Trick on Second Hand Cars.

Purchasers of second-hand cars besides making a thorough examination of the mechanical portion of the prospective investment, would do well to investigate the condition of the tires. It is an easy matter for the dishonest dealer to insert old and practically useless inner tubes in casings, which to all appearances are in good condition. Furthermore, re-treaded tire casings are not always what they purport, or appear to be.

RESTRICTIVE LAWS FOR GERMANY

Demand Made in Reichstag "for the Protection of the Public"—Government Promises Immediate Action.

Automobile legislation seems to be worrying the members of the German Reichstag as much as it does legislators in America, according to cable dispatches from abroad. Last week the question of automobile regulation in Germany came up in the Reichstag and provoked considerable discussion, the assurance being given by the government that it would put forth a stringent measure "for the protection of the public."

Prince zu Schonaich-Corolath began the discussion by calling upon Chancellor von Bulow to protect pedestrians by the prohibition of road racing, confining these contests to inclosed tracks. He also demanded the suppression by legislative measures of noxious odors arising from motor cars and examinations for chauffeurs, who should not receive licenses until they had driven at least 6,250 miles under the supervision of qualified instructors.

Herr Nieberding, the Secretary of State, replied, amid applause from all sections of the house, that a bill was ready for introduction in the Reichstag making the owners of automobiles fully responsible before the civil courts for accidents, while negligent drivers would be subjected, according to its provisions, to severe penalties, including fines and imprisonment.

Chauffeurs, henceforth, would be compelled to undergo examination relative to their technical knowledge of motor cars and their trustworthiness and skill as drivers. The questions of road racing and noxious odors will be left to the decision of a committee.

The government's action, it is stated, has been induced by recent official statistics of automobile accidents in Germany, which claim to show that from October, 1906, until October, 1907, there were 4,931 motor car accidents, involving 145 deaths and injuries to 2,419 persons, half of these occurring in Berlin. In 93 per cent. of the cases passenger cars were responsible. Among the victims 8 per cent. were the occupants of the cars and 76 per cent. were pedestrians.

New Yorkers to Circle the Earth.

Around the world automobile trips seem to be increasing in popularity. Burton S. Castles, a member of the New York Cotton Exchange; Frank Hubbard, partner of Charles G. Gates, and Clarence Hertie, have announced that they intend to start out next month for a tour around the world, taking in Japan, China and India. The three New York financiers will not attempt to break records, however, as they expect to be gone more than a year. Their avowed object is to have a good time, and to explore interesting and odd corners of the globe. They will use an American made car, and will take with them an American chauffeur and mechanic.

Would Confiscate Too Speedy Cars.

Like many of his colleagues in Massachusetts, Judge Lloyd B. White has decided views upon the question of automobile legislation. Judge White thinks a law should be passed prohibiting the manufacture and sale of automobiles capable of more than twenty miles an hour, and that the State should confiscate all cars that can go faster than this.

Judge White made known his ideas last week in refusing to postpone sentence on Dr. Charles W. Carey, of Quincy, found guilty of driving his car faster than the law allows in Hingham last September. His judgeship sat in Superior Court at Plymouth and delivered his opinion of automobile speeding when he said:

"Automobiles and automobilists will never be regulated until a law is passed absolutely prohibiting the manufacture and sale of machines capable of running at a rate of speed greater than 20 miles an hour. A way to effect this is to have the State confiscate all automobiles found within the commonwealth which have been proven to have been run at a greater speed than this."

After relieving his mind of this peroration his judgeship White fined Dr. Carey $25. The latter's attorney took exception to the ruling and took an appeal of the case to the Supreme Court.

Minneapolis Adopts Its New Ordinance.

As was expected, the Minneapolis city council passed the automobile ordinance which will require that hereafter automobilists and motorcyclists renew their city licenses each year, the charge for a renewal being 50 cents, instead of $2, as it was previously the case. Licensees will be given the privilege of taking out the same number each year, upon payment of 50 cents after the first year. Motorists will have to carry two tags, one of the State and one of the city, the latter containing the name "Minneapolis" in addition to the number of the tag and the year of issuance.

Jail for a Pittsburg Scorcher.

"I'll fine you six cents——" began Judge Brown, in a Pittsburg court, and Charles N. Smith, a chauffeur who violated the speed ordinance, smiled and picked up his hat to go.

"And," continued the judge, "sentence you to thirty days in the county jail!"

Smith forgot to smile as he was being led away. It was one of the first jail sentences for scorching meted out in Pittsburg.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

TO ROUT RIOTERS OR RAIDERS

Quaker City Motor Club Developing Military Spirit—Proposed Corps to Serve City, State or Nation.

Although Philadelphia has long been considered slow, the Quaker City Motor Club of that city is at least several minutes ahead of the calendar. It is ready to tackle either hoodlums, strikers, or Turks, in fact, it is ready for r-e-a-l w-a-r, if need be. Its advancement and ambitious valor is taking the form of a movement to organize a volunteer corps to render service to either city, State or nation in the suppression of lawlessness, or if need be, in repulsing foreign invasion in time of war. Thus it may come about that in the City of Brotherly Love, in a State founded by a member of that religious sect which opposes war, Uncle Sam's belligerent ability will be increased by the creation of an automobile auxiliary.

H. C. Harbach, the club's secretary, has sent to President Roosevelt a communication in which the plan is outlined briefly and which urges the president to accept the services of such a body. Accompanying the letter, a copy of which was sent simultaneously to Governor Stuart of Pennsylvania, and to Mayor Reyburn, of Philadelphia, was a preamble and set of resolutions adopted at a meeting of the club's board of governor's held on Thursday night last.

The preamble and resolutions which accompanied the letters, read as follows:

"The Quaker City Motor Club of Philadelphia, First Volunteer Motor Corps.

"Preamble: Whereas, The American automobile has thoroughly demonstrated its utility and reliability as a vehicle of rapid transit; and,

"Whereas, The march of progress demands both speed and endurance for all common carriers; and,

"Whereas, The automobile is the practical forerunner of advancing civilization;

"Now we, The Quaker City Motor Club, do hereby propose to enlist and enroll from among our members in good standing a sufficient number of capable and able-bodied men who shall agree to act as a volunteer motor corps.

"This volunteer motor corps is to offer its services and machines, through the Quaker City Motor Club, free to the City of Philadelphia, the State of Pennsylvaniaa nd the United States Government as an auxiliary force, in all cases of urgent need or dire necessity for the suppression of lawlessness and insurrection, or in the graver duty of repulsing foreign invasion in time of war. And,

"Whereas, The Quaker City Motor Club is only actuated by true patriotism and love of country, we most humbly pray your best consideration and prompt acceptance of this sincere proposal."

AIRING RHODE ISLAND MEASURES

Judiciary Committee of Legislature Gets Points for Automobile Laws—Things Said at a Hearing.

There was interesting variety in the protracted hearing given at Providence, R. I., on the 18th inst., by the House judiciary committee, which at present has charge of three new automobile measures, introduced in the State legislature. These measures consist of one introduced by Olney Arnold, providing severe penalties and specifying a definite speed limit; one introduced on behalf of the Rhode Island Automobile Club; and a third, introduced by Mr. Phillips of Coventry, which proposes a radical change in the existing law by placing the control of automobiles in the hands of the State board of public roads, instead of the Secretary of State.

The automobile club's bill was advocated by Col. Frank W. Tillinghast, of the club's special legal committee, who explained that the measure aimed to amend in some particulars the existing law which he declared to be in the main a satisfactory one. He condemned the proposition, embodied in one of the bills, which asks for an annual tax on automobiles, saying that such a thing should be labeled a means for raising money and not a means of regulating automobiles. In regard to licenses for operators, the speaker declared that annual licenses were not just or desirable.

In criticism of the bill advocated by Col. Tillinghast, it was shown by Mr. Hogan that, under provisions regarding the powers of the Secretary of State in revoking licenses, a man convicted of violating the law would have two court trials, a thing which none other could get. Col. Tillinghast admitted that this was true, and that the Secretary of State would not have power to revoke a driver's license until final conviction. But he expressed opposition to vesting the power of revocation in the courts of the State. He declared that it should be in a central body. The Secretary of State, in the speaker's opinion, was the best official to consider this problem.

"You are not dealing with a lot of lawbreakers; you are only providing against a few reckless persons," said Col. Tillinghast.

After reading the speed regulations provided for in the club's law the speaker continued:

"If every person drove his machine reasonably and properly there would be no complaints from any one about reckless operation. Upon this point there has been considerable discussion. We provide that 15 miles per hour in any city or compact section of any town or village is the speed limit. But we further limit this provision by saying that it shall be reasonable and proper at all times. Outside of these sections we do not fix any mile limit, but I think that 'reasonable and proper' fits the case exactly, and is what is desired. Other States are repealing their mileage limits because they find them unsafe."

Following Mr. Franklin, of Newport, who spoke in favor of having the owner of a car held equally responsible with the man who runs it, Col. Tillinghast again addressed the committee in explanation of the penalties provided for in his bill. This section places a fine of from $10 to $500 and imprisonment from 40 days to one year, in the discretion of the court. He showed that if a more severe penalty is provided for a second offense than for first, a man might get unjust treatment in court. The speaker explained this provision by saying that the second offense might be merely a technical offense and not worthy of a severe penalty.

The stock argument of making automobilists pay for the added cost of road maintenance charged against their vehicles figured in the hearing as a matter of course, and was combatted by Fred E. Newell of Central Falls in a vigorous speech, during which he said:

"Now, Mr. Chairman and gentlemen of the committee, I hope you will give this bill due consideration, before recommending it, for it looks to me as if there was a movement on foot to make one of the greatest blessings that progress has ever conferred upon man so expensive that none but the wealthiest people can afford to own one. Now this bill states that a person owning an automobile must pay each year not only a license but a registry fee for every machine he owns. Now I own three, not that I want to; I'd like to sell two of them. I am obliged to pay three fees and one license fee, to say nothing of three or four kinds of insurance on them. Is this right; is it a square deal? A man can own a team of horses and all kinds of wagons from a tip-cart to a six-horse moving wagon, yet he pays nothing. He wears out the roads and millions of dollars have been spent on the roads and streets for the wear and tear of his wagons and the nuisances of his animals long before the automobiles were heard of, but I never heard of any special tax or license they had to pay."

Discussion of the speed limit brought out a number of varying suggestions and was marked by a touch of the ludicrous in the declaration of H. H. Whaley, of North Kingston, who said automobilists go so fast through his town that they can't stand the wind on their eyes. "They can't look at the scenery because they go so fast," he said. "Once I went out to see the number of a machine, but gracious! the whole thing went by so fast I couldn't even see the machine itself!" Whaley favored a speed limit of 15 miles.

Another of the amusing points of the hearing was the suggestion made by Lellan J. Tuck, judge of the Tenth District Court of Pawtucket, who declared against the use of horns, and said: "An autoist who is equipped with a big horn or a siren feels that because he blows that horn every one else should get out of the way. Therein lies the trouble. I would advocate that no automobile be allowed to carry any horn or signalling device. If this was done the auto driver would be obliged to go at a reasonable and proper rate of speed at times where such is needed. Because a man can blow his horn he thinks he has a clear right of way. Take away a horn and the driver will be absolutely obliged to go slowly, and that is what we desire."

New York and Massachusetts automobilists were rapped by F. O. Strobridge, special automobile constable of North Kingston, who voiced the opinion of the town council in declaring the limit of fifteen miles too high, and added, "Rhode Island autoists are mostly gentlemen; it is the people from Massachusetts and New York that we have to look out for.

Speaker Burchard, of the House, who was the last to address the committee, spoke in favor of a graded tax on automobiles, grading the tax by the power of the respective cars, and fixing a minimum rate for cars used solely for commercial purposes.

The Horse was on the German.

When Herman Waubitzrider, of the Spring Garden district, Philadelphia, discovered the hood of an automobile snugly covered with a heavy lap-robe, he threw up both hands in amazement, and after stopping and pondering in his astonishment he decided that the curiosity aroused in him must be satisfied.

He determined then and there to make an investigation and ascertain, if possible, just what kind of an animal was being kept warm beneath the blanket. Approaching the machine, with all due caution, he raised the blanket and was peering beneath its folds when the owner of the car happened along.

Herman was in trouble in a moment, for the owner-chauffeur was inclined to think the man was bent on some mischief. He questioned the Spring Garden avenue German, and burst into laughter when the latter attempted an explanation.

"Vat iss?" inquired Herman. "No horse, no head, nottings to get cold. See, dere is notting but big iron box. Vat iss?"

It was explained that the blanket was used to protect the water in the radiator from freezing, the explanator adding that it also was done to keep the joints from getting stiff. Herman took another look, and said:

"Dot's alride about dot, but I can'd see vy iss it dot automobiles must vear blankets ven dere is no horse."

Thinking the motorist was trying to have fun with him, Herman stalked away in high dudgeon. Herman's address is not given. It probably is located in a Quaker fancy, but the fact does not spoil the readability of the story.

The Week's Patents.

874,401. Ball Bearing. Freidrich Greiner, Berlin, Germany, assignor to The Firm of Maschienbau-Anstalt Altenessen, A. G., Altenessen, Germany. Filed July 23, 1907. Serial No. 385,144.

1. A ball bearing comprising in combination an inner ring, an outer ring, large balls in the annular space between said rings, two flat rings having a plurality of slots arranged between said rings covering said balls in said annular space, a plurality of bridges having holes and small pins on their ends arranged between said balls and at right angles to said flat rings, said pins passing through said slots and connecting said flat rings together, and small balls in said holes between said large balls.

874,404. Variable Speed Power Transmitting Gear. Peter Hesselins and John Jaderlund, Chicago, Ill. Filed March 12, 1907. Serial No. 361,959.

1. In a variable speed power transmitting device, the combination with two rotative shafts arranged at an angle to each other, of a plurality of annular concentric gears mounted on one shaft, a plurality of gear wheels meshing therewith and loosely mounted on the other shaft, means for separately locking said gear wheels to their shaft, an intermediate shaft and two connected gears mounted thereon, one of said two connected gears meshing with a gear wheel on said gear wheel bearing shaft and the other meshing with one of said annular gears for the purpose set forth.

874,405. Automobile. Harry L. Ide, Springfield, Ill. Filed Aug. 15, 1906. Serial No. 330,746.

1. An automobile including its frame mounted upon wheels, a rocking cradle mounted upon the frame, and an operating engine mounted upon the cradle, said cradle having two bearings displaced longitudinally of the automobile and disposed substantially midway between the sides of the frame.

874,419. Clutch Mechanism. William R. McKeen, Jr., Omaha, Neb., assignor to Edward H. Harriman, Arden, N. Y. Filed Oct. 2, 1905. Serial No. 280,922.

1. In a device of the class described, in combination, a pair of clutch members provided with means adapted on said members being thrown into engagement one with another automatically to tend to draw the same together, said means comprising a plurality of teeth upon each member, the space between contiguous teeth upon a member increasing in a direction toward the roots thereof.

874,450. Gas Engine. Andrew J. Spicer, Franklin, Ind., assignor, by mesne assignments, of one-half to Elmer C. Russell, Indianapolis, Ind. Filed Oct. 22, 1906. Serial No. 340,011.

1. In a gas engine, the combination, with a combustion chamber having a smaller tubular extension, and a piston mounted in said chamber, of a cooling chamber surrounding the tubular extension, said cooling chamber having a valved inlet and outlet communicating with said chamber at one side of the tubular extension, and a passage forming a communication between that side of the piston opposite the combustion chamber and the cooling chamber at that side of the tubular extension opposite the inlet and outlet, whereby a cooling stream of air is propelled in alternately opposite directions through the cooling chamber, said cooling stream of air being divided and deflected by the tubular extension.

874,484. Vehicle and Spring Thereof. Elmer L. Brillhart, Pentwater, Mich. Filed Sept. 27, 1906. Serial No. 336,429.

1. A spring comprising oppositely disposed leaves each fulcrumed on the top of the other at the free extremity thereof.

874,520. Change Speed and Reversing Mechanism. George W. Marble, Chicago, Ill., assignor of one-half to William R. Donaldson, Chicago, Ill. Filed Jan. 10, 1906. Serial No. 295,372.

1. A friction speed transmission device embodying a continuously rotating shaft, a wheel rigidly secured thereon having a friction face at its hub and within its periphery, an oppositely facing friction disc or wheel slidably engaged upon the shaft and having a friction face adjacent the hub and within its periphery, a shaft journaled between said discs or wheels, a friction wheel rigidly secured on each end thereof, one extending into position to engage either friction face of the rotatable friction wheel, the other to engage either friction face of the rotatable friction wheel and means for shifting said friction wheels into engagement with the respective friction faces.

874,563. Power Transmission Device. Andrew Boulanger, Los Angeles, Cal. Filed March 26, 1906. Serial No. 307,984.

A power transmission means comprising a driving shaft, a plurality of gears rotatably mounted on the driven shaft and continually in driven connection with the driving gears, clutch drums connected to the respective driven gears and having rims with internal friction faces, clutch members mounted on and connected to rotate with the driven shaft and extending within the faces of the aforesaid drums, each clutch being provided with an elastic device in the form of a nearly complete ring, one end of which is fastened to the inner clutch member, the said ring extending within the annular drum rim and having an inclined end, an actuating member in each clutch moving radially and provided with an inclined portion for engaging the inclined end of the clutch ring to distend said ring, and an operating bar axially movable in the driven shaft and provided with an inclined portion to engage the said actuating member of each clutch, said operating bar being cylindrical and having flatted portions on each side of its inclined portion, said bar having notches in its flatted portion and a spring actuated device having a projection for engaging in said notches.

874,627. Transmission Gear for Automobiles. Charles W. Smart, Memphis, Tenn. Filed April 30, 1906. Serial No. 314,576.

1. In an apparatus of the class described, the combination with a driving shaft, of a friction disc arranged for rotation on said driving shaft, a pair of shafts mounted for rotation, one each side of the friction disc, and one of which shafts is arranged to be shifted longitudinally, and both of the shafts being driven from the driving shaft, a pair of opposed friction wheels mounted on the shafts and engaging on the side faces of the friction disc, means whereby one end of one of the shafts is moved to and from the friction disc, and means arranged upon the longitudinally moving shaft and upon the shaft carrying the friction disc for reversing the motion of said disc when the longitudinally moving shaft is shifted from one position to another.

874,657. Variable Gearing. Franz Burger, Fort Wayne, Ind., assignor of three-fourths to Henry M. Williams, Fort Wayne, Ind. Filed April 17, 1907. Serial No. 368,722.

1. The combination with a wheel having a plurality of concentrically arranged rings of friction surfaces theron and channels between said rings, of a pinion having a friction surface to engage said friction surfaces.

874,693. Explosive Turbine. Frederick W. Luedke, Trenton, N. J. Filed Aug. 15, 1904. Serial No. 220,846.

1. In a device of the class described, the combination with a turbine wheel, of an explosion cylinder having an exit adapted to deliver its charge to the turbine wheel for operating said wheel, means controlling the passage of the exploded charge through said exit to the turbine wheel, and means for exploding a charge within the cylinder, said charge exploding means being adapted to release the means controlling the passage of the exploded charge to the exit.

874,767. Shock Absorbing Device. George S. Hill, Bradford, Mass. Filed March 5, 1906. Serial No. 304,155.

1. A shock absorber for vehicles, comprising a drum and a band engaging the same, constituting co-operating frictional members, one of which is attached to the spring supported body of the vehicle and the other to the supporting base, said members being constructed and arranged to loosen the band when the body and base approach each other and to tighten the band when they separate, and adjustable means for limiting the loosening movement of said band.

874,802. Vehicle Steering Gear. John P. Simmons, San Francisco, Cal. Filed March 20, 1907. Serial No. 363,368.

1. A steering mechanism including a fixed wheel axle having horizontal disc-shaped tables at each end, and ball-bearings fitted around the lower side of said discs, a chambered wheel center within which said horizontal bearing is contained, means entering one side of said chamber and bearing directly upon one side of the disc shaped table ends of the axle to maintain a bearing contact between the opposite side of the chamber and the contiguous side of the table ends, a vertically disposed ball bearing, a wheel hub within which it is fitted, said bearing enabling the wheel to turn freely around the horizontally adjustable portion.

874,811. Motor Vehicle Driving Gear. George A. Weidely, Indianapolis, Ind., assignor of one-half to Harold O. Smith, Indianapolis, Ind. Filed June 1, 1907. Serial No. 376,825.

1. In an automobile, the combination, with an axle casing and a driving pinion, of an inner bearing and an outer bearing for said pinion, and suporting means for both of said bearings fitted upon the same portion of the axle casing.

874,844. Detachable Wheel Rim. Raymond Healy, Brooklyn, N. Y. Filed Dec. 28, 1906. Serial No. 349,759.

1. The combination of a tire carrying rim, a felly, a pair of side plates having inclined bearing edges for the rim expanded outwardly and having their inside faces between the felly and rim flush as described, and a pair of circumferential liners superposed in the space between the felly and inside of the rim, all as described to form an expansible solid bearing for the rim extending continuously from the outside of the edge of one plate to the outside edge of the

Digitized by Google

opposite plate, as and for the purpose described.

874,852. Differential Gearing. Wilhelm Lorenz, Karlsrube, Germany, assignor to The Firm of Daimler Motorengesellschaft, Unterturkheim-Stuttgart, Germany. Filed June 17, 1907. Serial No. 379,392.

1. A differential gearing comprising a driving shaft provided with a cylindrical part and a central differential shaft carrying a toothed wheel, coaxially arranged with the driving shaft, and a second differential shaft inclosing the central shaft, and provided with a casing having teeth, and planet wheels carried by the said cylindrical part and meshing with said teeth and the said central toothed wheel.

874,878. Vehicle Steering Device. Edward J. Vraalstad, Buffalo, N. Y. Filed May 29, 1906. Serial No. 319,367.

1. In a steering gear for vehicles, the combination with a steering rod, and a duplex screw thread thereon, of two nuts, one for each thread, a swinging member carried wholly by said nuts and actuated by the movements thereof.

874,913. Starter for Explosion Motors. Herman J. S. Lewis, New York, N. Y., assignor of one-half to John H. Dale, New York, N. Y. Filed March 4, 1907. Serial No. 360,346.

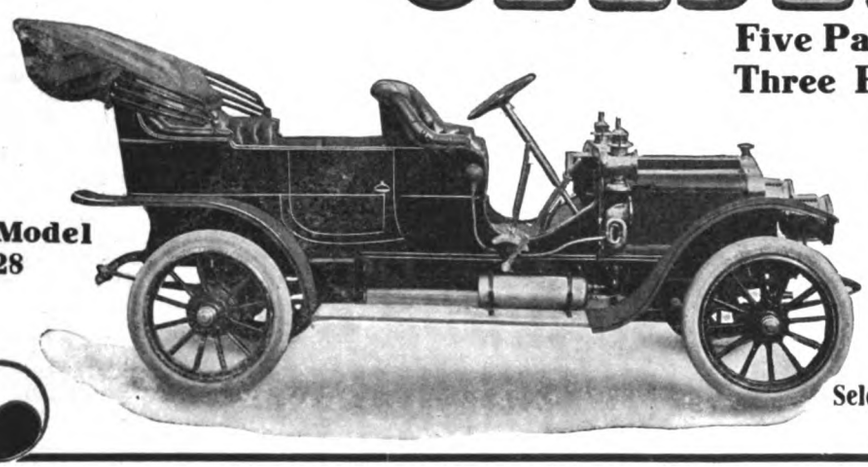
1. A spring operated starter for explosion engines comprising two parts or members independently revoluble on the crank shaft of the engine, a power spring impelling said members angularly with respect to one another, and a lever pivoted coaxially with said members and movable in one direction to engage one member to the shaft and movable in the other direction to engage the other member to said shaft, said directions being in the plane of rotation of said shaft, and means for holding the non-engaged member stationary in each case.

874,955. Sparking Mechanism for Explosion Engines. Louis A. Gianoli, Paris, France. Filed Jan. 29, 1907. Serial No. 354,782.

1. The combination with the rotary and stationary elements of a magneto generator, of a stationary insulating ring having an internal rack and contents, a rotary gear connected to said rotary element to be driven thereby, a planet gear of conducting material meshing with said rack and rotary gear, and adapted in its planetary movement to make electrical connections with said contacts, and a wire in which current is induced by the relative movement of the rotary and stationary elements, said wire being electrically connected to said rotary gear, substantially as described.

874,963. Holder for Automobile Top Bows. Stephen D. Hunter, Philadelphia, Pa. Filed Aug. 24, 1907. Serial No. 389,940.

1. A holder for the bows of an automobile top, comprising a rod, a member carried at one end of the rod against which one outside bow is adapted to abut, a series of spacing plates supported by, and freely movable along, said rod and adapted to be arranged alternately with respect to the bows, and an end plate carried by the rod and adapted to abut against the other outside bow and means to move the end plate toward said end member, thereby moving all the plates along the rod and clamping the bows.



874,964. Pneumatic Tire Protector. William M. Jamieson, Te Papa, near Onehunga, New Zealand. Filed July 11, 1906. Serial No. 325,728.

1. In a pneumatic tire protector, the combination of a box having a transversely corrugated plate adapted to be fitted to said tire, and means for securing a solid tire to the box.

874,978. Power Transmission Gearing. Vernon D. Munger, Beach City, Ohio. Filed March 29, 1907. Serial No. 365,342.

1. A power transmission gearing comprising a drive shaft, beveled pinions fixed thereon, a longitudinally adjustable driven shaft, a beveled gear wheel fixed thereon,

THE SELDEN CAR

Model 28

Five Passenger Touring Car $2000
Three Passenger Runabout $2000

AN ATTRACTIVE CAR AT AN ATTRACTIVE PRICE

SPECIFICATIONS—Engine, 4 cylinders, 4¼x4½, 28-30 brake horsepower. Transmission, 3 speeds forward and reverse, selective, Timken bearings. Wheel base, 109 inches; tread, standard; clutch, cone leather. Body, sheet metal, straight line type, roomy and comfortable. Tires, 32x3½, quick detachable; make optional. Frame, pressed steel, 4¾ inches deep. Front axle, single I-beam drop forging, ball bearings. Rear axle, bevel gear drive, enclosed type, roller bearings. Ignition, synchronized jump spark. Weight, empty, 2,200 lbs. (actual, not catalogue).

and other beveled gear wheels mounted on said driven shaft and movable longitudinally thereon, each gear wheel being nested in the next gear wheel of larger size.

874,989. Steering Gear. George G. Porter, Syracuse, N. Y., assignor to The Porter-Cable Machine Co., Syracuse, N. Y., a Corporation of New York. Filed June 10, 1907. Serial No. 378,202.

1. In combination with a steering member; a steering post; a gear secured to a steering member; a fixed gear provided with a greater number of teeth than the first gear; a pinion meshing with both of said gears; and connections between the steering post and the pinion for moving the latter over the gears.

875,053. Pneumatic Tire. Charles E. Duryea, Reading, Pa. Filed April 8, 1907. Serial No. 366,982.

1. A pneumatic tire having thickened edges, in combination with a rim grooved along its sides and provided with inflatable tubes adapted to firmly lock the edges of the tire within the grooves.

875,254. Automobile Frame Member. Matthew W. Gartshore, Reading, Pa., assignor to Parish Manufacturing Company, Reading, Pa., a Corporation of New Jersey. Filed April 5, 1906. Serial No. 309,971.

1. An automobile frame comprising pressed steel side members each having an inwardly extending bearing flange the edge portion of which is turned aproximately parallel with the vertical web at intervals and the unbent intermediate portions of which inwardly extending transom connecting brackets with integral ribs, and separate transom members entending between the vertical web portions of said side members and said bracket ribs and rigidly bolted to said brackets substantially as set forth.

875,297. Gasolene Engine. George W. Stanley, Logansport, Ind., assignor of one-eighth to George D. Miller, one-eighth to Ernest A. Tucker, one-eighth to Arthur E. Stanley, one-eighth to Frederick H. Klinsick, and one-eighth to William D. Craig, Logansport, Ind. Filed Aug. 20, 1906. Serial No. 331,352.

1. The combination with an engine having cylinders arranged in oppositely disposed sets, pistons in said cylinders, a power shaft, piston rods connected to said power shaft, a parallel shaft driven from the power shaft, valve chambers carried by the cylinders, valves in said chambers, eccentrics on the second mentioned shaft, blocks on the eccentrics, straps holding the blocks in place, and means for pivotally connecting two valves of oppositely disposed cylinders to the same block.

875,321. Transmission Mehcanism. Samuel C. Carter, Los Angeles, Cal., assignor of one-third to Carlisle H. Esler, Los Angeles, Cal. Filed Aug. 14, 1906. Serial No. 330,615.

1. The combination with a driving shaft of a plurality of gears shiftably mounted thereon, a housing for said gears, means for shifting said gears with respect to said driving shaft, wheels on said driven shaft, gears mounted on said driven shaft, and means for shifting said gears and said driven shaft for causing a variable rotation of said wheels.

875,351. Resilient Tire. Isaac W. Hodgson, Minneapolis, Minn., assignor of one-fourth to Philip W. Herzog, St. Paul, Minn. Filed Feb. 25, 1907. Serial No. 359,047.

1. In a resilient tire, the combination with a rim, of a tread made up of a multiplicity of yieldingly connected tread sections, and springs interposed between said rim and tread sections, and having interlocking engagement at their outer ends with the adjacent ends of said tread sections, substantially as described.

875,358. Combined Brake and Steering Knuckle. Joseph E. Landry, New Bedford, Mass. Filed Oct. 18, 1907. Serial No. 398,101.

1. In combination, an axle beam, an axle, and a knuckle joining them, the axle member of the knuckle being a disc journaled to the beam on a vertical axis.

875,401. Variable Speed and Reversing Gear. James Worthington, Manitowoc, Wis. Filed May 6, 1907. Serial No. 372,169.

1. The combination of a driving shaft, a beveled gear wheel theron, a set of transmission shafts, a beveled gear wheel on each, arranged to mesh with the beveled gear wheel on the driving shaft, transmission gears on said transmission shafts, operatively connected with the corresponding beveled gear wheel, a driven shaft, and shiftable gear wheels thereon adapted to be moved into and out of mesh with the transmission gears.

875,472. Induction Coil and Box for Explosion Engines. Richard Varley, Englewood, N. J., assignor to Varley Duplex Magnet Co., a Corporation of New Jersey. Filed July 24, 1907. Serial No. 385,378.

1. An induction coil unit for explosion engines comprising a U-shaped sheet of paramagnetic material, an L-shaped frame assembled therewith to form a casing, and an induction coil within such casing.

875,508. Automobile Train. Angelo De Luigi and Carlo Ramazzotti, Milan, Italy. Filed March 22, 1906. Serial No. 307,763.

1. In a traction device, a train of vehicles, each having a pivoted axle, two telescopic members over said pivot having a cardan joint at their outer ends, bevel gearing connected with each joint, and chains for transmitting power to and from said gearing.

875,534. Magneto Igniting Device for Explosive Engines. Henri de la Valette, Paris, France. Filed Sept. 7, 1905. Serial No. 277,423.

1. A magneto-electric machine, comprising an armature, oscillating field magnets, an oscillating distributor of induced currents, and means for mounting the magnets and distributor, whereby they oscillate cooperatively one with the other about the axis of the armature.

"The A B C of Electricity." Price 50c. The Bicycling World Co., 154 Nassau St., New York City.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—No. 14 sliding gear transmissions; 90 bodies, primed only; 75 bodies, painted only; 72 bodies, painted and trimmed; 69 sets bevel drive axles and hubs; 130 frames, unassembled; 30 frames, assembled; 35 radiators; 50 tanks; 59 two-cylinder opposed engines, 5¼5; 105 sets springs; 48 mufflers; 98 sets universal joints; 47 steering wheels, 14-inch; also various quantity of other parts, all suitable for 2,000 pound touring car or runabout. RANDS MFG. CO., Detroit, Mich.

FOR SALE—$100 to $500 saved. Buy a good second hand car now for next season. Write me to see how much I can save you on others sacrifice prices. Light touring cars and roadsters, including Thomas, Pierce, Packard and Peerless, and other standard makes from $640 to $1,680. C. T. PAXTON, 1200 Niagara St., Buffalo, N. Y.

FOR SALE—300 sets 28x3 best grade artillery wheels, fitted with clincher rims, less hubs. Write for bargain prices on single sets or the lot. THOMAS B. JEFFERY & COMPANY, Kenosha, Wis.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

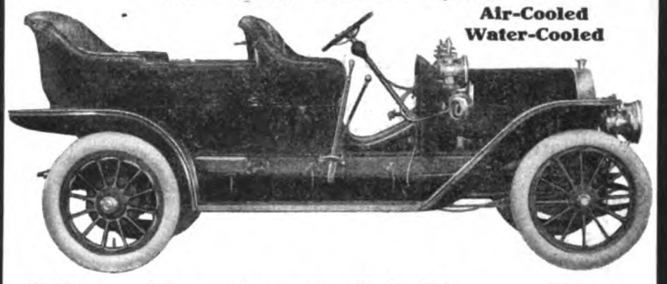
Ability, in an automobile, is a matter of mechanism, not of body design.

External beauty has not been slighted in the Marmon—a glance or two shows that.

But, to the man who really seeks a dependable car, we recommend something more important—a careful study of the mechanism of the Marmon.

In every detail of construction—motor, control, transmission, lubrication, suspension system, materials, workmanship—he will find a distinctive excellence, a score of notable patented features.

The Marmon's dependability—as reliable as that of a railroad train—commends it to the prudent man.



The Marmon's ease of motion—found in no other automobile—makes it a prime favorite with women.

For every dollar invested, including purchase price and maintenance, there are two to three times as many miles of actual service in a Single Cylinder Cadillac as in any other motor car.

This is not an empty claim. It is a fact borne out by the experiences of 16,000 users all over the world. Many of these have owned their Cadillacs for five years, have driven their cars 60,000 miles or more and are still using them.

No

Cadillac

so far as we know, has ever been discarded because worn out or unfit for further service.

If you want to know

The Truth About The Automobile and What It Costs To Maintain One

send for our 64-page Booklet containing the SWORN affidavits of a large number of users showing an average expense for repairs to car of less than 50 cents per week and averaging more than 18 miles per gallon of gasoline under all road conditions, mud, sand, snow, hills and mountains.

The booklet contains many interesting experiences and remarkable performances and proves conclusively the wonderful capabilities of the Single Cylinder Cadillac. It contains much information and advice which every prospective automobile buyer wants to know.

Be sure to ask for "Booklet No. 6."

Cadillac Motor Car Co., Detroit, Mich.

Members of Association of Licensed Automobile Manufacturers.

THE INCOMPARABLE

WHITE

THE CAR FOR SERVICE

White Scores the Usual 100 Per Cent.

The two White Steamers entered in the Bay State Automobile Club Endurance Run, February 22d, finished with perfect scores. Although the conditions of the run were not sufficiently severe to eliminate as large a proportion of the contestants as is usual, it should be noted that the White was the only make of those entering more than one car which brought through all of its cars with perfect scores.

In this respect the run resembles:

1—The Quaker City Motor Club Endurance Run, January 1-2, where the single White entry was the only car to make a perfect score, thus winning the contest from the 27 gasoline cars which competed against it.

2—The Chicago Motor Club Endurance Run, November 25-28, where the White was the only make which brought through all of its cars without road penalties.

3—The 1907 Glidden Tour wherein the White was the only make represented by three or more cars which was not penalized.

This regularity of the White performance, as compared with the extreme irregularity of the performance of cars of the other style of motive power, has established beyond question the superior reliability of the White.

The Wrong Way

Note Deflection at Universal Joint

The Rambler Way

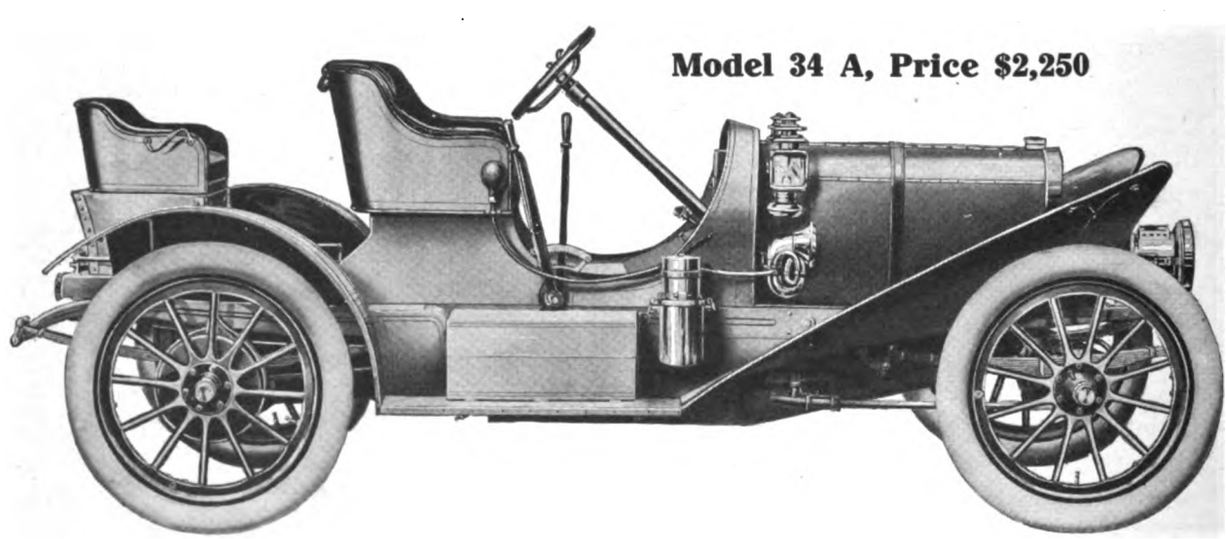
No Power Lost in Transmission

Rambler Straight Line Drive

Of the new ideas in automobile construction none are of greater value than the straight line drive system as applied to the 1908 Ramblers.

It is well known that no matter how good or carefully made the universal joint, there is an inevitable loss of power and great wear due to deviation from a straight line in the power transmitting system and the loss increases with the square of deflection.

With the Rambler straight line drive there is no deflection, hence no loss and the full power of the motor is delivered to the driving axle.



This is but one of many valuable features; our catalog tells of others of equal value; write for it today.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, March 5, 1908. No. 23

MORTON TRUST CO. MAKES A MOVE

Places Itself in a Position to Foreclose Electric Vehicle Co. Mortgage—if Deemed Advisable, Says Counsel.

The Morton Trust Co., of New York, which, as trustees, holds the $2,250,000 mortgage bonds of the Electric Vehicle Co., Hartford, Conn., now is in position to file action for foreclosure whenever it deems advisable.

On Thursday last, 27th ult., Judge Cross sitting in the United States Circuit Court at Elizabeth, N. J., directed the Electric Vehicle Co. to show cause on the following Monday why the trust company should not be permitted to file such a bill and on that day signed an order granting such permission.

When a Motor World man yesterday sought A. W. Putnam, general counsel for the Morton Trust Co., to learn the result of Monday's proceedings, and asked for particulars of "the proceedings looking to foreclosure on the Electric Vehicle Co.," Mr. Putnam at once replied that "no action of the sort had been taken."

When evidence was produced, and in response to further inquiries, he stated that the action in question did not necessarily imply foreclosure. He explained that when the receivership proceedings were instituted, the court, as is usual in such cases, issued an injunction restraining the filing of any and all suits against the company. The Morton Trust Co. merely had sought to have this injunction modified sufficiently to place them in position to bring foreclosure proceedings. Mr. Putnam made the point also that when the receivers were appointed the court did not declare the Electric Vehicle Co. insolvent, as one report had stated.

When pressed for the real meaning of the trust company's action, Mr. Putnam declined to be more specific.

"It simply means that the court has granted a preliminary order permitting us to file a bill to foreclose the mortgage if we deem it advisable to do so," was all he would say.

Meanwhile, the receivers have put about 100 men to work in the Hartford factory to finish the cars which were in a state of partial completion at the time of the failure in December last. It is stated that buyers are in sight for practically all of the cars that will be made up.

"A. A. D. A." Gives up the Ghost.

The Association of Automobile Dealers of America—what there was of it—is off, that is, off the map. It was never very much more than a name and a few large newspaper paragraphs, and all these and anything else that may have assumed tangible shape, have been taken over and will be decently interred and forgotten by the National Automobile Dealers' Association, which was formed during the Chicago show in December last by a group of legitimate dealers. C. A. Wardle, of New York, who fathered the "A. A. D. A.," fixed its dues at $25 per year, and selected himself as general manager, is no longer so keenly interested in the retailers' welfare. He has secured a good berth in the insurance business.

Budlong's Successor not yet Selected.

No successor of M. J. Budlong as general manager of the Association of Licensed Automobile Manufacturers has been yet selected. The executive committee held a meeting in New York on Tuesday last, but no choice was made, nor is there any clue to the man for the place. Another session of the committee will be held next week, until which time Mr. Budlong will remain in office.

Perrett Leaves the Diamond Service.

W. M. Perrett, for several years manager of the Diamond Rubber Co.'s Detroit branch, has resigned that office. Temporarily, the vacancy will be filled by George J. Bradley, who is in charge of the Diamond depot in Cleveland.

TRYING TO MAKE TROUBLE FOR POPE

Unfriendly Toledoans Sue for His Removal as Receiver—Basis of the Suit and the Allegations Made.

Toledo interests which for several months apparently have been striving to make trouble for the receivers of the Pope Motor Car Co. returned to the attack again late last week. Their latest onslaught took the form of a petition filed in the United States Circuit Court in Toledo praying for the removal of Albert L. Pope and George A. Yule as receivers of the company.

The petitioners allege that these receivers have conducted matters without proper regard for the Toledo creditors; they assert that $800,000 in claims against the Toledo plant are held by the Pope Mfg. Co., of Hartford, in which the present receivers are personally interested; further that these accounts do not appear on the books of the Pope Mfg. Co., which leads the petitioners to doubt their validity. The petitioners charge that Yule and Pope by past transactions indicate their desire to dismantle the Toledo plant, and seek to substantiate this charge by citing the sale of old and obsolete tools and machinery from the Toledo plant to the Pope Mfg. Co. last year and the return since last November of these implements to Toledo charged against the Toledo plant at the original invoice prices.

The case was heard by Judge Robert W. Taylor on Saturday last. Johnson Thurston, a Toledo attorney, appeared for the plaintiffs, and Clarence Brown, of Toledo, and Lewis H. Freedman, of New York, for the receivers. After a short hearing, in which no vital point was brought out, Judge Taylor suggested that it were better that both sides to the dispute settle the matter among themselves and adjourned the case without date. On Monday, the Toledo papers reported that an agreement had been reached to release Receiver Pope and

Digitized by Google

to retain Mr. Yule as sole receiver; but the report is mere moonshine.

It can be stated authoritatively that Messrs. Pope and Yule are in accord and working in entire harmony. There are no differences between them and at any future hearing that may be set by Judge Taylor, they will appear and present testimony to prove the falsity of the allegations made in the Toledo petition.

From the best information obtainable, it appears that in Toledo there are men possessed of personal grievances, and who long have been gunning for Albert L. Pope and seeking to disturb the peacefulness of his tenure as receiver. They are said to represent less than $5,000 of merchandise creditors, but they have the ear of the Toledo press and periodically have been able to create "sensations" which have been wired to the four winds. The mouthpiece of these persons is a Toledo lawyer who formerly served the Pope interests, but who was not retained when the receivership was instituted. It is only a few weeks since that a tall story of the alleged refusal of the Pope receivers to grant an option on the Pope-Toledo plant to Joseph M. Schwab was floated, despite the fact that an option not only had been granted but renewed, although Schwab had advanced no money. The latest renewal of this option expired on February 24th, following which the present movement ostensibly to remove Receivers Pope and Yule, but in reality aimed only at Pope, was undertaken. Several of the creditors have expressed themselves as deploring the Toledo attitude. They say the continued effort to create disturbance has served more than anything else to injure the Pope-Toledo interests.

Meanwhile the receivers have accumulated a fund of several hundred thousands of dollars out of which it is believed a creditors' dividend of about 20 per cent. shortly will be paid. It is necessary to secure the sanction of the Federal courts in so many States that not even an approximate date of payment can be set.

Colt Had but $30 Cash on Hand.

Schedules in bankruptcy filed last week by the Colt Runabout Co., New York, which started with a splurge and died young, show liabilities of $14,213 and sixteen other claims, the amounts of which are unknown, and assets of $1,875. The latter, which give a clue to shadowy foundations on which the concern was reared, consist of stock, $1,075; tools, $50; office furniture, $70; accounts, $650, and cash $30. Among the creditors are Kane & Robinson, Chicago, $4,000, secured; Minneapolis Steel & Machinery Co., $2,700, secured; and South Side Garage, Kansas City, Mo., $2,000.

The Pacific Coast Taximeter Cab Co. has been organized in San Francisco with capital stock of $1,000,000. When it will begin operations is not known as to date the venture does not appear to have advanced beyond the "stock for sale" stage.

In the Retail World.

Roberts & Gardner have opened at 93 Jefferson avenue, Grand Rapids, Mich. They will handle the Jackson.

The Simplex Motor Co. is one of Boston's latest additions; it opened sales rooms at 173 Huntingdon avenue last week. W. H. Woods is its manager.

Hall Brothers will open a garage in Manitowa, Wis., and have begun the erection of a suitable building. The firm has taken the agency for several cars.

E. C. Bald, well known as a former racing crack, has located in Pittsburg. He will be sales manager for the Crescent Automobile Co., agent for the Ford.

H. Paulman & Co., Chicago agents for the Pierce Arrow, have opened a branch at 217 Fourth street south, Minneapolis, Minn. R. J. Randolph has been installed as manager.

The Wabash Automobile & Electric Co., 925 Wabash avenue, Terre Haute, Ind., is erecting a concrete garage at 662-4 Ohio street, that city. Its dimensions will be 140x50 feet.

Officers have been elected by the Mississippi Valley Automobile Co., St. Louis, as follows: President, Max Orthwein; vice-president, James A. Seddon; secretary-treasurer, Harry S. Turner. The officers constitute the board of directors.

Walter L. Githens, formerly treasurer, has been elected president of the Chicago Automobile Trade Association, Henry L. Paulman taking the office of treasurer. Frank Sparks was chosen secretary and Harry Tillotson, vice-president.

Charles P. Root, for three years editor of Motor Age, became a real tradesman last week when he established himself at 431 Wabash avenue, Chicago. He will handle the Dorris car, in addition to a line of motor boats.

Fire destroyed Frederick J. Lovatt's garage at 331 South Orange avenue, South Orange, N. J., Friday night last, 29th ult. All but two cars were saved. The total loss was about $20,000, the insurance not being stated. The cause of the fire also is unknown.

Lynn C. Lull, vice-president and general manager of the Auto Vehicle Co., of Los Angeles, died as he was being taken to a hospital in Detroit, February 21st. He had been ill for several months with heart disease, but had recovered sufficiently to start east on a business trip.

The Boyer Motor Car Co., located at Golden Gate avenue and Larkin street, San Francisco, has been attached by the sheriff. The company, which was agent for the Franklin and Royal Tourist, recently suffered by fire, which is said to have helped bring about the present predicament. The general belief, however, is that the company will be straightened out of its financial difficulties.

What is claimed to be the best equipped garage in Ohio, was opened to the public on Sunday last in Cleveland. It is the new four story garage of the Citizen's Motor Car Co., and besides offices, waiting rooms, salesrooms and machine shop, has capacity for about 500 cars. The building cost $300,000. On the opening day several thousand people viewed the big garage, listened to music from a band especially engaged for the occasion, and carried home souvenirs in the shape of flowers.

The Week's Incorporations.

Warren, Ohio.—Valley Automobile Co., under Ohio laws, with $20,000 capital. Corporators—H. C. Farnham, A. W. Sykes, John A. Fuller, E. G. Davis, and Evan Thomas.

Boston, Mass.—Taxicab Co., under Massachusetts laws, with $300,000 capital. Corporators—Harold F. Parker, president; Joseph A. Little, treasurer, and Herbert H. Frey, Boston.

Newark, N. J.—Star Motor Car Co., under New Jersey laws, with $25,000 capital; to deal in automobiles. Corporators—Lester B. Harris, Leon B. Harris and Paul F. Gillette, all of Newark.

YEAR BEGINS WELL IN EXPORTS

January Figures Show Substantial Net Gain —Growth in Sales of Higher Priced Cars Abroad.

An auspicious opening for the year's exports of American automobiles and parts was afforded by the business recorded during the month of January, ult., which exhibited a net gain of $29,185 over the corresponding returns of January, 1907. Oddly enough, however, a smaller number of cars was exported than last year, the respective quantities being 180 as against 214. Owing to the increased valuation of the more recent shipments, the valuation for cars alone showed an increase of nearly $58,000; more than offsetting a decrease of some $28,600 in value of exported parts.

A still more curious fact is revealed on examining the distribution of the exports. Only two countries, and one general group shared in the increased business. The United Kingdom, with an increase of $128,107, France, with $12,635, and "Other countries" with about $800, were responsible for the net gain in the total figures. Of the eleven geographical divisions netting less business for the month than last year, British East Indies, Italy and British North America lead.

During the seven months ending with January 31st, 1,367 complete cars were exported, as against 1,369 for the same period of 1907. But again the increased valuation of the product served to overcome a decrease in the valuation of parts, leaving a net gain in business of $284,000, or thereabouts. Of the six divisions showing gains for this period, the United Kingdom leads with $336,291, France with $96,561, and the West Indies and Bermuda, South America, and Germany following with $82,476, $37,967 and $13,072, respectively, Mexico with $191,167. British Australasia and British North America exhibited the most marked declined. The report in detail follows:

	—January—		Seven Months Ending January		
	1907	1908	1906	1907	1908
Automobiles and parts of	.....	.....	$1,438,600	.....	.....
Automobiles*	$311,242	$369,075	.....	$2,103,550	$2,391,460

* Number not stated prior to July 1, 1906.

Annual Report of a Rubber Company.

In the annual report of the Consolidated Rubber Tire Co., which last year added automobile pneumatic tires to its productions, a decrease is shown in gross sales for the year ended December 31 last of $88,634, and in net earnings of $28,505. Following is the income account, with comparisons:

	1907.	Decrease.
Gross sales	$1,133,213	$88,634
Other income	70,653	3,847
Total income	$1,203,866	$92,481
Operating expenses	1,146,856	63,976
Net earnings	$57,010	$28,505

These net earnings were sufficient to pay 2 per cent. on the $2,850,500 4 per cent. 50-year sinking fund bonds, as compared with 3 per cent. in the year previous.

According to President Cartwell's report to the stockholders, the decrease occurred during the last three months of the year, after the financial disturbance set in.

Rigdon to Represent the Republic.

Samuel G. Rigdon, for many years the general representative of the Goodyear Tire & Rubber Co., Akron, Ohio, and who has several times covered practically the entire country in the Goodyear interests, has gone with the Republic Rubber Co., Youngstown, Ohio, which last year took up the manufacture of automobile tires. Rigdon will represent the company as general representative of the automobile tire department.

Puritan Takes Over Old Colony Assets.

To satisfy a mortgage, the assets of the Old Colony Light Co., Boston, have been sold, and the property purchased by the Puritan Gas Tank Co., of the same city. To settle the outstanding indebtedness of the old concern, the Puritan company voluntarily has offered the creditors shares of its 6 per cent. non-cumulative preferred stock on a basis of 100 cents on the dollar.

L. J. Sackett has engaged with the Matheson Motor Car Co., Wilkes-Barre, Pa. He will have the title of special representative.

MORSE'S COMPANY READY TO QUIT

Temporary Receivers Appointed for the Mercedes Import — Probability of Voluntary Dissolution.

The Mercedes Import Co., of New York, of which Charles W. Morse, the dethroned and indicted "ice king," and financial wizard was the financial backer, has gone into the hands of temporary receivers. Supreme Court Justice Platzek appointed John S. Primrose, Henry S. Colwell, and Eugene L. Bushe temporary receivers Friday last, 28th ult., fixing their bond at $25,000.

The Mercedes Import Co. maintained pretentious offices and sales rooms at 590 Fifth avenue, Arthur Braun, former secretary to Mr. Morse, is president of the company; John S. Primrose, treasurer, and Robert E. Fulton, secretary. Mr. Morse is a creditor for $25,000, and the National Bank of North America a creditor for $55,479. Other creditors are Arthur Braun, $12,500; R. E. Fulton, $6,300, and C. L. Charley, $43,800. The total liabilities are $115,104, and the nominal assets $146,978.

The assets consist of merchandise, $62,517; accounts, $59,647; bills receivable, $15,215; furniture and fixtures, $6,294; cash, $3,129, and deposits, $249.

The company was incorporated September 18, 1905, with a capital stock of $100,000. Allen & Halle, who inaugurated the taximeter cab service in this city, were at first interested in the company, and afterward Mr. Morse became the backer. Recently C. L. Charley of Paris became uneasy about the company's decreasing business, and sent his brother, Harry, here to investigate. The application for the appointment of receivers was made by officials of the company in proceedings for voluntary dissolution of the corporation, which recently lost the Mercedes agency for America.

Corbin Officials in New Positions.

At the annual meeting of the Corbin Motor Vehicle Co., Buel B. Bassette was promoted from the assistant treasurership and secretaryship to treasurer, and Guy Hutchinson, formerly the New York manager, was elected secretary. The following directors were chosen: Philip Corbin, Charles M. Jarvis, Charles H. Parsons, Charles Glover, Howard S. Hart, Maxwell S. Hart, Buel B. Bassette, Andrew J. Sloper, and Guy Hutchinson. The following were the officers chosen: President, Howard S. Hart; vice president, Maxwell S. Hart; treasurer, Buel B. Bassette; secretary, Guy Hutchinson.

Babcock Opens a Chicago Branch.

The Babcock Electric Carriage Co. has established a branch in Chicago at 1328-1339 Michigan avenu. It is in charge of C. M. Atterbury.

NEW YORK, MARCH 5, 1908

Sound Waves in Motor Cars.

Among the manifestations of progress, most striking of which are the new problems which are constantly coming up, are the new methods of attacking old problems, which, being less spectacular, for the most part pass unnoticed by the public at large. Thus, the telephone having ceased to be a marvel in the eyes of the average user, modifications in its application and even the introduction of new principles in a subsidiary way, excite less comment to-day, than far less important innovations would have done twenty years ago. So, the motor car having risen to the distinction of a common utility, alterations in its design and the introduction of new methods of studying its phenomena must be of conspicuously evident moment in order to interest the average user.

It is hardly more than a year since the proposal of the Royal Automobile Club to determine the practical utility of motors of current design by means of exhaust gas analyses was hailed with more or less ridicule. Yet the sequel has proved that not only may a good check on carburation be obtained by examining the spent product of the engine, but even a measurable test of the accurary of its physical proportions as well. In the same way, credit is due to British thoroughness in discovering in the refractory cake on cylinder walls and combustion heads, several valuable clues as to carburetter performance as well as lubricating difficulties which, hitherto, had not been suspected to exist. The occultism or apparent irrelevancy of any method of analysis or synthesis does not of necessity preclude all possibility of its ultimate value to the investigator, provided only it has a logical attachment to the subject in hand.

So the notion of designing the automobile with the aid of a tuning fork and a compendium of harmonics instead of by the more obvious and simple method of applying the callipers and scale to someone else's car, is manifestly absurd. Even the idea of further perfecting design by the roundabout method of reducing vibration wholly within the co-ordinate parts appears a little far fetched. At the same time, since vibration is known to contain the germ of truth on which that mysterious and hardly tangible "fatigue of metals" is based, it is resonable to suppose that a certain amount of care expended in applying the laws of wave propagation and interference may be of value in extending the dynamic properties of the structure.

Certainly in so far as it may be applicable in reducing the hum of the parts it is an advance in science which is bound to advertise itself. It frequently happens that the study of vibration is applied with great success in the design of large buildings, bridges and other evolutions of modern engineering. And it is by no means unlikely that the theory advanced in the Fay-Ellsworth paper printed in another column, while adding gray hairs to the head of the automobile designer, may also prove instrumental in prolonging the useful life of his product.

The Wisdom of the Farmer.

One of the most encouraging symptoms to be discerned in the retail situation just now is the rapid and wholesome development of the farmer market, particularly in the broad area which the New Yorker usually dismisses indefinitely as the "middle west." Until within a year or two this factor was viewed largely as a bright future prospect. Present indications point strongly to the fact that it has developed into a feature of real merit, comparable with that of the market of the cities and smaller towns. Efforts which have been put forth to awaken this branch of the market have not been in vain and a good line of business is in sight.

Primarily it has been supposed that the farmer and the farmer's motor buggy would be inseparable. The amount of business done by the motor buggy makers is sufficient to justify this impression absolutely, so far as it goes. But it further appears that a portion of the farmer market has invaded the realm of the second-hand car, and with proverbial shrewdity, if not with the gullability which is supposed to be inherent to the ruralist, has brought to the dealer a surprising amount of sound knowledge of motor matters.

Here is at once an inlet for the wise dealer and an outlet for the foolish. Because a purchaser is going to take his car 30 or 40 miles up state, it is natural to suppose it an easy thing to use him as a sort of unwitting grave digger to assist in the elimination of valueless wares. Even with his intelligence and wisdom it is possible to palm off a surprising amount of junk on the agriculturist, just as it is possible to trick the city dweller. But setting aside any possible scruples in the matter, it is a weakness in the plot, that it is possible to accomplish only one such interment in any given locality. Such practice must inevitably lead to a progressive narrowing of the field.

The modern farmer is not the Reuben of the conventional melodrama. Particularly as found in the middle west, he is a broad, wholesome figure, familiar with modern methods and equipment through reading and hearsay, if not by actual contact. He farms by wholesale and profits or loses in four or five figures, and he must be something of a business man in order to be anything of a farmer. Most of all, his eye is fixed upon the main chance, and however much he may want the motor go-cart, he wants the motor-utility vehicle even more, and is anticipating the time when he can reduce the cost of his crops by eliminating animal traction to the greatest degree possible. Therefore it pays to take care of the farmer. For in caring for his interests, the dealer is not building for his future trade alone. Because of the value of the personal

Digitized by Google

testimonial, caring for the farmer, also involves caring for the farmer's neighbors.

The Question of Equipment.

What promises to be a moot point in the industry at some not distant day is the question as to what equipment properly should be included in the selling price of the car. At the present time the spectacle is presented of one group of makers marketing their product with practically no equipment, of another including in the purchase price such accessories as tools, dash lamps, tail lamp and horn, and of a third, making a feature of the fact that the single cost figure is inclusive of everything necessary to the maintenance and operation of the vehicle, including acetylene lamps, top, and a truly liberal set of tools and replacements.

In a general way, this may be considered a point of no particular importance in its effect on marketing conditions, in as much as it might be taken as a foregone conclusion that a few dollar's worth of accessories would not hold as a valid consideration one way or the other with the unbiased and intelligent purchaser of a motor car. From a more intimate view point, there appears to be more involved in the matter that at first is evident, however. And if ever a definite trend should be discovered one way or the other, there can be no question that the car market might be affected to a certain extent and the accessory market very materially in consequence.

Accompanying the introduction of the latest crop of new models from the various factories, there have been several indications pointing to a possible increase in the tendency to make the equipment more inclusive than ever before, as instanced in one case by the adoption of the catch phrase, "Nothing to buy but the license." In other quarters are found makers who are constantly becoming more and more rigid in their adherence to the principle that the purchase price of the vehicle should cover only its actual cost together with a fair margin of profit, while the manufacturer should not confuse his own interests with those of the dealer by going wholesale into the accessory business.

Theoretically, the complete equipment, when made to include all that is legitimately required for operating the car, involves a certain protection of the customer from possible misrepresentation and chicanery on the part of the agent and retailer, eliminate the possibility of virtual price-cutting on the part of the dealer who is disposed to "throw in" certain inducements in order to swing a sale now and then, and carries by inference the suggestion that the purchasers' money buys a great deal more than would be the case were the accessories left out and the price proportionately reduced—it has above all, then, a certain amount of advertising value. This latter consideration is of material importance, however, only so long as this practice is the exception rather than the rule.

Were the practice of furnishing extensive equipments to become general, it would seem that its first material effect would be upon the accessory trade; a substantial portion of the market would be transferred from the selling to the building season, orders would be closed on large contracts with stipulated deliveries, and the turnover would depend directly on the manufacturing rather than on market conditions. At the same time the dealer's position would be altered somewhat, in that his accessory sales would be confined largely to replacements and to dealings with owners of old cars who desired to improve their equipment, or to those who incline toward sumptuous trappings for the machine regardless of cost or actual requirement in the absolute sense. The ultimate tendency would be to simplify the retail selling proposition to a certain extent, place the bulk of the accessory business on the same footing as the parts industry and finally, through competition, to settle market values for complete cars. Its ultimate effect on the accessory manufacturers and on the jobbers and retailers is not, however, so easily foreseen.

Perils of the Rebuilt Car.

Always there is the peril of the persuasive mechanic, who for small remuneration is anxious to rebuild your car and give it "50 per cent." more power, or speed, or carrying capacity, or 50 per cent. more something than its maker meant it to have, and always there is the peril of the car which has passed through his hands. But never is either peril quite so imminent as during the early days of promised spring, when the owner of moderate means is tempted to "improve" his car through economy.

Whatever the type of car, and regardless of its original cost or make, this fact must be borne in mind; that its makers probably allowed no more strength in any single part than its maximum normal service seemed to require. Increasing the power, increasing the weight, or increasing the carrying capacity—which are the same thing, incidentally involve an increase in all strains, both due to load and traction, to which the parts are subjected, and the increase involves not one or two, but practically every part of the fabric. It is not that improvements are impossible to the average car, nor that it will not stand modification in a variety of ways. The point is that such alterations invariably should be made advisedly and under the supervision of a competent engineer. Otherwise the rebuilt car is a distinct and positive menace to safety and usually a wasted investment.

COMING EVENTS

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 2-8, San Francisco, Cal.—California Woman's Automobile Club's show in Coliseum.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

March 15-April 1, Omaha, Neb.—Omaha Automobile Dealers' Association's annual show in the Auditorium.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

March 18-24, New Haven, Conn.—New Haven Automobile Dealers' Association's show in Music Hall.

March 18-25, Rochester, N. Y.—Rochester Automobile Club's show in new Convention hall.

April 24, Westchester County, N. Y.—Briarcliff trophy race for stock cars.

Suppose that several dozen men in half a dozen wagons drawn by half a dozen horses undertook a race from New York to Paris—or to Chicago, for that matter. Suppose the horses got stalled or went lame and that as a result a half dozen motor cars were fastened to the shafts and drew the wagons for mile after mile—what would the world say? Would it inspire faith in horses? In other words, is the New York-Paris circus performance proving a good advertisement for automobiles or automobiling? There are those who maintain that it would have been better had it never started.

BOSTON BORROWS FROM JAPAN

New England Show to Have a Japanese Setting—List of Exhibitors is Long and Impressive.

Not apple blossoms but wistaria; not a New England apple orchard but a bit of old Japan, will supply the setting for the Boston show, which begins its week's run in Mechanics Building, on Saturday evening next, 6th inst.; and which like all previous Boston shows, it promises to prove a show worthy of being classed with the national exhibitions. It was Boston that set the fashion in respect to uniform decorations and each succeeding year the setting has been both distinctive and beautiful.

The decorative scheme for the forthcoming occasion will be entirely Japanese. In the grand hall the back of the stage will have a drop curtain depicting a scene in Japan, while Japanese flags will be a feature of the bunting decorations. The spaces will be separated by private hedges with bay trees at the ends next the aisles, and in the centre of the grand hall will be a large fountain with trees and flowing water. In exhibition hall also the Japanese effect will be carried out with Japanese temple arches. All through the building great quantities of wistaria and other artificial blossoms will be used to add to the Oriental atmosphere. Attendants, too, will be dressed in Japanese costume, and, for home consumption only, it is stated that the Japanese government will have representatives present to "pick up points" for automobile manufacture.

The Bostonians take a lot of very pardonable pride in their automobile show. They attend in large numbers and even those of them who do not know a spark plug from a hole in the ground enjoy their visits. They seem to consider it a sort of midwinter picnic. They sit for hours listening to the music, the while contentedly eating peanuts or popcorn. The first night always is the "great night." It is then that passes are most plentiful; and the Boston populace makes the most of them. It comes early and stays late. It lines up long before the doors are opened and once opened, the building is packed to suffocation. To the stranger, the crowd on the opening night is itself worth going far to see, wholly apart from the exhibits and the decorations.

From the trade standpoint, the Boston show always proves of importance. Although the cars are staged by the local representatives, notable absentees are not numerous and it is seldom that several new cars, or cars that have not been displayed at any other show, do not make their appearance. On Sunday night Mechanics building will contain more of the latter sort than on any previous occasion. Of 211 exhibitors, 60 of them will exhibit a total of 89 different brands of cars, of which number 12 were not seen either at the New York or Chicago exhibitions. They are as follows: Palmer & Singer, American Mercedes, De Dion, Brouhot, Stanley, Clark, Viking. Shawmut, Springfield, Stilson, Crown buggy and Bailey Electric.

In the 142 accessory exhibitors who have booked space, are included nearly all the big tire makers and producers of other appurtenances, the host of new ones being unusually large. In the climate of New England the small accessory manufacturer seems to flourish. He will be present in force and all during the week his number usually is increased by ones and twos.

The full list of exhibitors is as follows:

Automobiles.

The White Co.—White.
J. W. Maguire Co.—Great Arrow.
Thos. B. Jeffery & Co.—Rambler.
Stanley Motor Carriage Co.—Stanley.
Curtis-Hawkins Co.—Grout, Chadwick, Babcock Electric.
Geo. J. Dunham—Royal Tourist.
Winton Motor Carriage Co.—Winton.
Reed-Underhill Co.—Knox.
Corbin Motor Vehicle Co.—Corbin.
Park Square Auto Station—Berliet, Stoddard-Dayton.
Peerless Motor Car Co.—Peerless.
Fred S. Smith—Autocar, Apperson, Walter.
Geo. H. Lowe—Imperial.
J. W. Bowman Co.—Stevens-Duryea.
Mills-Kennedy Co.—Welch, Springfield.
S. R. Bailey & Co.—Bailey Electric.
Morgan B. Kent—Hotchkiss, Stearns.
W. M. Jenkins & Co.—Mitchell.
Shawmut Motor Co.—Shawmut.
Dodge Motor Vehicle Co.—Pope-Toledo, Pope-Hartford, Pope-Tribune, Pope-Waverly.
Allen-Kingston Motor Co.—Mercedes, Allen-Kingston.
F. R. Parker & Co.—Elmore.
W. A. Frederick Co.—American, Overland, Marion.
Franklin Automobile Co.—Franklin.
F. E. Wing—Marmon.
Harry Fosdick Co.—Atlas, Springfield, Baker Electric.
Locomobile Co. of America—Locomobile.
Columbia Motor Vehicle Co.—Columbia.
Maxwell-Briscoe-Boston Co.—Maxwell.
Ford Motor Co.—Ford.
Morrison-Price Co.—Rainier, Wayne, Mora.
A. T. Fuller—Packard, Cadillac.
Boston Motor Co.—Acme.
Matheson Co. of Boston—Matheson.
H. C. & C. D. Castle—Lozier.
Premier Boston Depot—Premier.
Linscott Motor Co.—National, Reo.
Edward S. Clark—Clark.
Whitten-Gilmore Co.—Thomas.
F. E. Randall Co.—Pullman, Stilson, Pennsylvania.
Algonquin Motor Car Co.—Oldsmobile. Columbus Electric.
Lane Sales Co.—Lane.
Oakland Motor Car Co.—Oakland.
South End Car Co.—Brush.
Northern Motor Car Co.—Northern.
Palmer & Singer Co.—P. & S., Simplex.
D. P. Nichols & Co.—Frayer-Miller.
K. A. Skinner—De Dion, Brouhot.
A. R. Bangs—Viking.
Ferd. F. French—Schack.
Waltham Mfg. Co.—Waltham-Orient.
Butler Motor Car Co.—Rapid, Cleveland, Pierce-Racine.
Chas. A. Eaton—Lambert.
H. C. Stratton—Kissel Kar, Car de Luxe, American Mercedes.
Dragon Motor Co.—Dragon.
The Fiat Co.—Fiat.
Renault Freres Selling Branch—Renault.
R. S. Crawford—Crawford.
Studebaker Bros. Co.—Studebaker.
Bostonia Motor Co.—Cartercar.
Crown Motor Car Co.—Glide, Crown Buggy.

Motorcycles.

Crouch Motor Co.—Crouch.
Hendee Mfg. Co.—Indian.
Light Mfg. & Foundry Co.—Light.
Ovington Motor Co.—F. N.
American Motor Co.—Marsh.
Reliance Motor Cycle Co.—Reliance.
Merkel Motor Co.—Merkel.
Reading Standard Company—R-S.
Aurora Automatic Machine Co.—Thor.

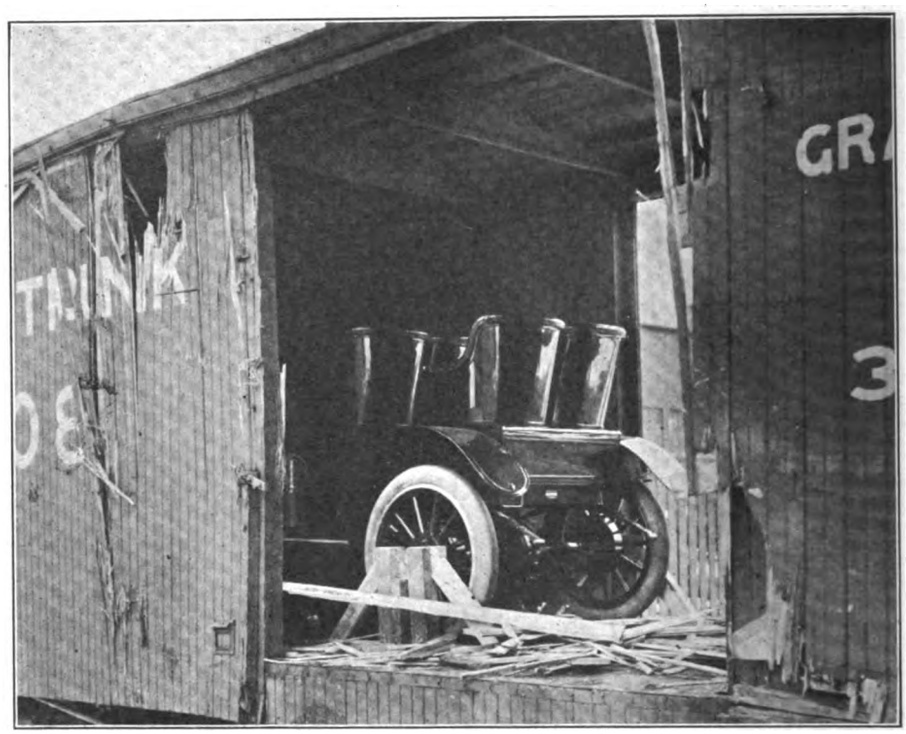
Engineers' Society to Meet in Boston.



The regular quarterly meeting of the Society of Automobile Engineers will be held in Boston, during the course of the show there. It will be opened on Tuesday evening, 10th inst., by the reading of a paper on electrical ignition, by J. O. Heinze, at the Massachusetts Institute of Technology. The following morning at 9.30 a visit of inspection will be paid to the laboratory and factory of the Heinze Electrical Co. In the evening a dinner will be held at the headquarters of the Bay State Automobile Association, and this will be followed by the regular meeting and the reading of papers.

Among the subjects to be dealt with are "Perfecting Automobile Ignition," by J. O. Heinze; "Design of Automobile Crankshafts," by P. M. Heldt; "Heavy Goods Transportation Systems," by Joseph A. Anglada; "Automobile Forgings," by Richard W. Funk, and "A Year's Use of Denatured Alcohol," by Thomas L. White.

IMMUNE IN A RAILWAY WRECK

Runabout Uninjured Though Car Carrying It was Shattered—Value of Careful Loading. Strikingly Illustrated.

When an automobile in a freight car goes through a railway wreck without getting hurt, while the car in which it was loaded was badly smashed, it speaks well for the automobile and the manner in which it was loaded. For the science of loading cars for shipment is a fine are which has been developed to its present state only after many costly exprimnts.

FRANKLIN CAR THAT DEFIED WRECK

A Franklin 28 horsepower runabout which left the factory at Syracuse last Saturday in a box car, over the D., L. & W., bound for Baltimore, suffered an experience of the sort. At Messengerville, N. Y., not far from Binghampton, the axle of one of the freight cars broke and all of the following cars in the train were thrown off the track. The car in which the Franklin was shipped bumped up against a string of freight cars on one side and then caromed across the track and collided with a house on the other side. The force of the impact drove a large section of weather boarding right through the end of the car, tearing a great hole in its side.

A 4x4 oak door casing on the car was splintered, three oil boxings were smashed and a truss rod pulled all out of shape. In spite of all this rough handling, however, the Franklin motor car came through without a scratch, as shown in the accompanying photograph. The automobile was not even jerked from its blocks notwithstanding the tremendous shock when the car hit the house. The runabout was removed from the freight car and forwarded to the purchaser in Baltimore.

Packard Designs a New Body.

Th Packard Motor Car Co. have brought out what they term a close-coupled body, which is a compromise on the touring car and the runabout. At first glance it differs not at all from the form of a five passenger body, save that it is slightly more compact and that it is fitted with a rumble seat. The design of the body aims to so bring and distribute the weight of the passengers between the front and rear springs, that a light load or a heavy one will not make much difference in the comfort obtainable.

Supplementary Spiral Spring Moves.

The Supplementary Spiral Spring Co., of St. Louis, manufacturers of the supplementary spring, have removed their New York office from 52 W. Sixty-seventh street, to the Motor Mart, 1876 Broadway. M. H. Cormack, formerly vice-president of the Standard Brake Co., is in charge of the office, his territory including the States of New York and New Jersey.

Mercedes Repudiates Sisterhood of Maja.

Although the Maja car was heralded in this country as "the sister of Mercedes," not all the members of the family seem convinced of the truth of the assertion. The new American representatives of the Mercedes has "no sisters, brothers, cousins, uncles or aunts."

THE LETTER TO LOUGHBOROUGH

Task of Carrying the Message to Fort Leavenworth Nearly Completed—"Gumbo" Worse than Snow.

After making a truly remarkable run half way across the American continent, the Studebaker car which is carrying a message to Loughborough—that is, to Colonel Robert H. R. Loughborough, in command at Fort Leavenworth, Kan., from General F. D. Grant, commander at Governor's Island, N. Y., was almost stalled while practically in sight of its destination. Snow drifts that were encountered east of Chicago could be dug through, but the Kansas mud—"gumbo", they call it—proved an anchor almost too great for the 30 horsepower car to pull against. Late last night it was reported nearing Atchison, and making pregress slowly through two and three feet of mud, while fifty automobiles are waiting to escort the army dispatch car into Fort Leavenworth if it reaches Atchison this morning (Thursday).

Record-breaking in the summer time when there is nothing to watch but the road may contain many elements of excitement, but it is as nothing compared to a winter ride, with snow drifts, slush, mud and other dangerous things to buck against. There is no doubt but that the Studebaker's ride from New York City to near Fort Leavenworth, Kan., has been eventful and replete with "incidents."

As has been detailed in the Motor World the car left New York on Tuesday, the 18th ult., six days after the New York-Paris "tourists" left, and following in their trail proceeded up the Hudson river to Albany. Beyond Albany the roads were found to be in terrible condition and the tow path along the Erie canal was taken, as offering the least resistance. The first real thrill came when the car ran suddenly on a large patch of ice and shunted off the tow path in the canal. Fortunately the ice was strong enough to hold the car and a gang of Italian laborers helped push it back on the tow path.

Buffalo was reached on Thursday, 20th ult., and the car was driven up to Fort Porter to secure the signature of Captain Lafitte. Cleveland, Toledo and Michigan City were the next large cities visited, the latter place being reached on Tuesday, the 25th. The run from Michigan City to Chicago was accomplished that afternoon, the Studebaker having passed every car in the New York-Paris run. It might be added, however, that the Studebaker was driven night and day with alternate crews.

From New York to Chicago the car had been digging through snow drifts, and although much of the snow was left behind the Windy City it wasn't a circumstance to the sticky, clinging mud, hub deep, that it had to wallow through in Iowa, Nebraska and Kansas, after making a good run across Illinois in one day. Bad as the conditions were the car reached Omaha at 5 p. m. Sunday, 1st inst., and after a night's rest the tired crew started on the last lap down the westerly side of the Missouri river. It passed through Greenwood, Neb., at 11 a. m. Monday morning and then began the battle with Kansas mud. Detailed reports are lacking, but telegraphic reports show that the car is practically fighting its way through two feet of mud, literally foot by foot. It is expected to reach Fort Leavenworth some time this morning.

PICTURESQUE BUT STRENUOUS INCIDENT OF CARRYING THE MESSAGE TO LOUGHBOROUGH

DATE FIXED FOR GLIDDEN TOUR

A. A. A. Touring Board Selects Buffalo for Starting Point—Victor Breyer to Represent Association Abroad.

This year's Glidden Tour will start from Buffalo, N. Y., on Wednesday, July 8th. Positive announcement of this fact was made by Frank B. Hower, chairman of the touring board, at the meeting of the board of directors of the American Automobile Association held in New York City, Tuesday morning, 3d inst.

The announcement was not unexpected as Chairman Hower several weeks ago had semi-officially stated that this date would probably be decided upon by the directors. The announcement of Tuesday followed an official adoption of the date. July 8th was selected as the most propitious time for starting such a tour and as the roads and legislative convention is to be held in Buffalo on Monday and Tuesday, July 6th and 7th, it was considered appropriate that the annual tour should start on the day following. All the affiliated clubs within touring distance of Buffalo will be asked to promote runs to finish in Buffalo on July 5th and to attend the good roads convention.

Neither the rules for nor the itinerary of the annual Glidden Tour have yet been announced, but Chairman Hower stated that he is at work upon both. The route selected will probably take in Cleveland, Pittsburg, Baltimore, Philadelphia, New York City and Boston, with a termination in the White Mountains.

Most of the work transacted at Tuesday's meeting was routine, but the interesting announcement was made that the Association has secured the services of Victor Breyer, of Paris, who managed the Grand Prix race last year, to act as the Association's European touring consul for the present year. Members desiring to tour abroad may rent cars, employ chauffeurs, or obtain any information they desire through Mr. Breyer without charge to them. Breyer is an Englishman by birth, but has lived in France all his life and as he is considered one of the best informed sporting men in Europe his services should be of real benefit. Breyer also acts as the European representative of the National Cycling Association of this country.

Applications for membership were received from the Automobile Club of Vermont, which comprises in its membership several clubs in that State, as a State association, and from the West Virginia State Automobile Association, as well as from several individuals, and the applications were favorably received. This makes five State associations admitted since the annual meeting in January, the others being the Delaware Automobile Association, the Automobile Club of Hawaii, and the California State Automobile Association. Twenty-one State associations now are affiliated.

President W. H. Hotchkiss presided at the meeting, the other directors in attendance being George E. Farrington, treasurer; F. H. Elliott, secretary; J. D. Thompson, chairman of the racing board; Frank B. Hower, chairman of the touring board; Robert F. Hooper, chairman of the good roads board; Lewis R. Speare, of Boston; Edward Kneeland, of Pittsburg; S. L. Haynes, Springfield; Paul C. Wolff, Pittsburg; Isaac Starr, Jr., Philadelphia; George A. Post, Paterson, N. J.; John P. Coghlin, Worcester, Mass., and Giles H. Stilwell, Syracuse, N. Y.

Many Duties for Few Dollars.

The question as to the relative importance of the chauffeur in the staff of household servants may still be debatable on this side of the pond, but in England it seems to have been settled by one family, a clergyman and his wife, who have very clear ideas of the duties of the man who may be engaged to drive them about. That their prospective employe might thoroughly understand what would be required of him, the following rules and regulations were compiled by the good wife and submitted to each applicant as he appeared at their little home in the suburbs:

Motor driver's duties.—Be at the rectory from 6.30 a. m. till 7 at night; take entire charge of the car and clean and polish it; manage the pony; milk the cow; feed the chickens, pig, etc.; clean the boots and knives; mow the lawn and garden; no meals here; touch his hat to us; ride a bicycle, must work on Sundays, and wear decent clothes and a billycock hat.

The salary was $5 per week.

Taber Wins Trophy a Second Time.

By winning the annual hill climb of the Corona Automobile Club at Corona, Cal., February 22d, A. L. Taber further established his claim on the challenge cup offered by the club to the driver winning the annual climb three times. As Taber made the fastest time at last year's meet he will have to win once more to secure the trophy permanently. The day was ideal for the event and although only five cars made the ascent all Corona was out to witness the affair. The distance was 3.1 miles, with a grade of from four to eight per cent. The cars finished in the following order: A. L. Taber, Wayne, 5:43; W. C. Barth, Tourist, 8:32;A. L. Taber, Oldsmobile, 8:52; Charles Allen, Buick, 9:05, and Tom McGuire, Oldmobile, 12:15.

Automobile Road Planned by Texans.

Texas automobilists are planning to construct an automobile road between Fort Worth and Dallas, with the aid of the highway commissioners. Should the road be built a midway clubhouse will be established at Arlington.

NEW YORK CARNIVAL PROGRAM

Big Parade Planned as the Chief Feature—One Section to Exemplify History of the Automobile.

The New York Automobile Trade Association finally has definitely decided on the chief features of the program for "carnival week," April 6th to 11th. The suggested day parade, open to all comers and in which it was thought one thousand cars might be in line, has been abandoned. Instead, the semi-historical parade, which first was proposed, will be carried out and will occur Tuesday night, April 7th. Some explorer having discovered that automobiles first were introduced into New York City ten years ago, that discovery will supply the peg on which the celebration will be hung, in other words, it will mark the tenth anniversary of the introduction of automobiles into New York City.

R. G. Howell will be grand marshal of the parade, which will comprise four divisions. The first division will be made up of cars made in 1903 and earlier. It is planned to make this division a moving exposition of the development of the automobile from its beginnings down to the time when it may be said to have become standardized. The carnival managers will make efforts to have all of the famous racing cars that have made history in races for the Vanderbilt and Bennett cups and that now are in this country in the historical section of the parade. The stock cars that have been entered for the Briarcliff trophy race in Westchester county on April 24 will also be eligible for places in the first division.

The second division will be reserved for the dealers and will be subdivided into three sections, for the steam, gasolene and electric types of cars, respectively. The third division will be open to all automobile owners and will be the decorated section. Owners who put their cars in this section will be requested to decorate them and two prizes will be offered for the two cars that are most beautifully decorated. There will also be a prize for the car having the most unusual decorations. The fourth division will be open to commercial vehicles.

On Thursday, April 9, there will be a hill climbing contest on some grade not yet selected. The stores along Automobile Row will keep open house during the week.

The Federal Bill Considered Too Drastic.

Considering the proposed national automobile law too drastic in some of its provisions, Congressman Gillett of Massachusetts will endeavor to amend the bill. One of the objectionable provisions would make a person violating the law ineligible for reregistration within five years. This is an entirely friendly proceeding on Mr. Gillett's part, inspired by the Springfield Club.

LESS THAN THREE MILLS PER MILE

Per Capita Cost of Travel in Long Island Economy Run—Knepper Receives the Award of Honor.

That traveling in automobiles over frozen roads is more economical than in railway cars was proven beyond a doubt by the 242 miles economy run over Long Island roads Tuesday of last week, 25th ult., conducted by the Long Island Automobile Club, the tabulated results of which were made public on Friday last.

As told in last week's Motor World, 23 cars started in the run, all but four of which finished. After considerable mental effort the technical committee of the Brooklyn organization arrived at the results, which show that the winner was H. K. Knepper, who drove a Frayer-Miller car. On the run Knepper's car consumed exactly 13 gallons of gasolene and used 1 quart ½ pint of oil, which, on a basis of 25 cents and $1.00 per gallon, respectively, made the total cost $3.56. There were five passengers in the car, the cost per passenger being 71⅕ cents. As the railroad fare for the same trip from Brooklyn to Amagansett and return is $5.28, the comparison is obvious.

Honors were closely contested, R. A. Vail, Franklin, finishing second, with a per capita cost of 71½ cents. Vail used 9.875 gallons of gasolene and 2.5 quarts of oil, but as he carried one passenger less than Knepper, the cost per passenger was thereby increased. Third prize went to Robert Morton, who drove a Pullman. His total cost for five passengers was $3.91, making an average of 78⅕ cents. There was only one cent's difference between the next two finishers, I. C. Kirkham's Maxwell scoring 79⅗ cents per passenger, while the per capita cost for C. G. Arnold's Pope-Hartford was 80⅕ cents. The cost per mile for each person on Knepper's car was something less than three mills. The full scores are given in the subjoined table:

H. K. KNEPPER, FRAYER-MILLER, WINNER IN ECONOMY RUN

Driver and Car.	Gasolene (gals.)	Oil (qts.)	Total cost.	Passengers.	Cost a passenger.
H. K. Knepper, Frayer-Miller	13.000	1.25	$3.56	5	$0.71⅕
R. A. Vail, Franklin	9.875	2.50	3.10	4	.77½
Robert Morton, Pullman	13.125	2.50	3.91	5	.78⅕
I. C. Kirkham, Maxwell	14.937	1.00	3.98	5	.79⅗
C. G. Arnold, Pope-Hartford	14.000	2.12	4.03	5	.80⅕
M. A. Martin, American Mors	21.125	4.62	6.44	7	.92
Philip Hines, Pope-Hartford	14.875	4.50	4.85	5	.97
C. A. Carlson, Winton*	26.375	0.87	6.82	7	.97 3-10
W. Walton, Acme	25.50	2.00	6.88	7	.98 2-7
W. A. Bowers, Thomas-Detroit	15.218	4.50	4.93	5	.98⅗
D. C. Teeter, Rambler	15.937	3.12	5.01	5	1.00⅕
J. W. Mears, Acme*	24.878	3.50	7.10	7	1.01 3-7
H. Minchenor, Lozier	27.775	4.50	8.07	7	1.15 2-7
C. Hosley, Maxwell	22.50	1.50	6.00	5	1.20

W. A. Flinn, Acme*	30.375	3.75	8.53	4	2.13¼

* Six cylinders.

TAME SPORT ON ORMOND BEACH

"Crippled" Entrants Reduce the Already Thin Fields—Large Crowd Sees Series of Uninteresting Runaways.

It looks very much as if the Ormond beach speed carnival had "shot its bolt." Indications to that effect which were apparent last year, are multiplied on the present occasion. Not even the proud name of the Automobile Club of America, which this year is standing as the sponsor of the carnival, has served to help. Outside of Florida, interest scarcely has been lukewarm. Spectators and entries both have been hard to attract. The carnival was to have been inaugurated on Monday last, but as several of the few entrants had not arrived, the opening events were postponed until Tuesday, and then, although the weather was all that could be desired and the crowd considerably larger than has yet attended an opening day, the sport was flukey and disappointing.

The beach was far from its usual good condition and the fact that both races—the 100 miles for the Minneapolis trophy and the 160 miles for stock cars, which was reduced to 150 miles, proved uninteresting runaways, to say nothing of there being several scratches in each event and only two cars in each running at the finish, did not serve to put the crowd in very good humor. In the 100 miles race the time was more than a half-hour slower than the record, and although a record was claimed in the 150 miles event for stock cars, for the reason that it was the first race ever held on the Florida beach at a longer distance than 100 miles, the time made in it was not startling, and is far from representative of the speed that can and has been obtained on the tide washed strip of beach.

As a large grandstand had been erected in front of the club house at Daytona, which was comfortably filled with persons who had paid fancy prices to witness uninteresting runaways, both races were started from that point. Neither of the expected loops at each end of the course had been built, and as the course laid out for Tuesday's races was only 12½ miles in length, numerous turns were necessitated.

The start of the 100 miles race for the Minneapolis trophy was not encouraging. Of the six original entries three had to be withdrawn. The Renault was out because of a broken oil pipe and the Haynes had been withdrawn with a broken crankshaft, it was stated, while the B. L. M. was said to have tire trouble. Therefore only three cars started, the 60 horsepower Fiat, with Cedrino at the wheel; the front drive Christie, driven by H. W. Blakeley, and a 120 horsepower Hotchkiss, in charge of H. B. Shefts.

Although Shefts was the first off the mark

Digitized by Google

Cedrino overhauled him before 100 yards and was soon out of sight, while Shefts laid up inside of the first mile with tire trouble. The Christie car made the first turn all right, but stopped shortly after with a broken valve. When Cedrino came up to the grandstand after the first turn one of the front tires was missing and he stopped some time to replace a stop on a pet cock. It was not until after he had returned that he replaced the tire. No sooner had he got under way again than the tire ripped off, and this time he was delayed 20 minutes. His time for 20 miles was 15:37, and for 25 miles, 26:39, while Shefts covered the same distance in 47:28. At the 50 mile mark Cedrino had gained a big lead, his time being 1:04:05, while Sheft's was 1:17:51. It was simply a runaway for Cedrino, and although he drove most of the distance on three tires and about half of the way on two tires, he was never in danger of being overtaken by Shefts. Cedrino finished the 100 miles in 1:50:20, which is 34 minutes 40 seconds slower than the record for the distance, made by Walter Clifford-Earp in 1906. When Cedrino finished Shefts was at the 75 miles post, but no time was taken.

Four starters lined up for the 160 miles race for stock cars—which was reduced to 150 miles—as follows: E. W. Howard, 45 horsepower Allen-Kingston; J. Hunsley, 45 horsepower Cleveland; Louis Bergdoll, 60 horsepower Benz; and J. Carey, 60 horsepower Thomas. Bergdoll got away first at the start and led by a good margin at the 25 miles stake in 25:15, with the Thomas second and the Cleveland third. The Allen-Kingston melted a bearing early in the race and was withdrawn. Bergdoll reached the 50 miles post in 1 hour 1 minute 2 seconds. Carey had withdrawn and the Cleveland passed the half century mark at 1:17:27. One hundred miles was reached by Bergdoll in 1:47:31. Bergdoll continued in the lead until the finish, the time for 150 miles being 2:40:53. Hunsley was on the last stretch when Bergdoll finished. The summaries:

One hundred miles for Minneapolis trophy—Won by Emmanuel Cedrino, 60 Fiat; second, H. B. Shefts, 120 Hotchkiss. Time, 1:50:20.

One hundred fifty miles for stock cars—Won by Louis Bergdoll, 60 Benz; second, J. Hunsley, 45 Cleveland. Time, 2:40:53.

If Tuesday's racing was a disappointment that on Wednesday was even tamer. The only event decided was the 125 miles event for the so-called "gentlemen amateurs," which resulted in a runaway after half the distance had been covered, for Louis Bergdoll, a Philadelphia dealer. As the existing A. A. A. rule classifies every one engaged in the automobile trade as professionals, how Bergdoll qualified as an amateur is past understanding. Three cars started and two finished the race. Before the race there was considerable comment regarding the weight of the Benz, which tipped the scales at about 300 pounds over the international limit. By agreement the objection was waived and the car was permitted to start.

Two fires were the only occurrences to relives the day's monotony. Joe M. Gilbert, of Continental tire reputation, had decided to become a racing man for the occasion, and had entered his Packard car for the amateur event. Gilbert was tuning up his car before the race, when a short circuit started a small blaze. A bystander picked up what he supposed was a can of water and doused the burning car with it. Unfortunately it proved to be gasolene instead of water. Needless to add, Gilbert did not become a race driver. Quick work with fire extinguishers and sand prevented the total demolition of the car, but it was rendered unfit for racing.

A few hours later Harry Levey's big Hotchkiss gave an exhibition of fireworks on the beach opposite the judges' stand, and the officials had a chance to play volunteer firemen. The car was put out of commission for the time being. Crippled cars seem to be playing a prominent part in the meet. The Haynes was put out of the running before the meet commenced and all efforts to get the B. L. M. car that was constructed for the Vanderbilt race, but which did not start, into commission have proved futile. Latest reports state that the transmission is askew. Paul LaCroix's Renault has a broken oil pipe, which it is expected may be replaced in time for the car to participate in to-day's race.

The beach was in better condition than on Tuesday, and faster time resulted. The race for "gentlemen amateurs" originally had been scheduled for 128 miles, but as the course had been reduced to 12½ miles instead of 16 miles, as was first intended, the event was made 125 miles to conform with the change.

There were only three starters—Bergdoll in the Benz, S. B. Stevens in the Fiat, and R. G. Kelsey in the Christie. Bergdoll got off the mark first, but was soon passed by Stevens, the latter reaching the club house after the first turn, more than a mile ahead of the other two. His time for 25 miles was 20:40. Bergdoll covered the distance in 22:54, and Kelsey in 37:07. Stevens also led at the 50 mile post in 41:37, with Bergdoll second in 46:41. In the next 25 miles misfortune overtook Stevens, in the shape of a broken rocker arm on the engine of the Fiat. A touring car was dispatched for another part, but half an hour was lost before Stevens got going again. The Christie car had in the meantime developed engine trouble and retired. Bergdoll kept plugging along and finished 75 miles in 1:07:49, 100 miles in 1:30:35, and completed the distance in 1:53:30⅕. Stevens had covered 95 miles in 1:54:28 when Bergdoll crossed the finishing line. The summary:

One hundred and twenty-five miles for gentleman amateurs—Won by Louis Bergdoll, 60 horsepower Benz. Time, 1:53:30⅕. Also ran—S. B. Stevens, 60 horsepower Fiat, and R. G. Kelsey, 50 horsepower Christie.

Object Lessons for Farmer Solons.

The committee on agriculture of the House of Representatives of the State legislature of Kentucky was "joy riding" last week. Unlike most "joy riders" the agricultural committeemen are not grafting rides by false pretences. Quite the opposite is the case, for they are being importuned to take rides around the State in cars furnished by members of the Automobile Club of Louisville.

In the language of one of the automobile club's legislative committee, the State legislators are being "shown not the way an auto ought to auto, but how an auto does auto."

In other words, in an endeavor to kill a bill introduced recently by Representative "Windy Bill" Thompson, which is now in the hands of the committee on agriculture, is responsible for the demonstration to these members. They will be shown that a rate of ten miles per hour on a flat level country is absurd and that a $50 to $500 fine for an offense is an outrage.

The bill introduced by Representative Thompson amends Section 1 of the present law to read, a maximum speed of ten instead of fifteen miles per hour, and increases the fine for infraction from $10 to $100 to from $50 to $500.

Naturally, the automobilists object to this clause, and it is by actual speedometer tests that they hope to impress upon legislators the real meaning of the proposed "ten-mile limit."

Postmaster Morgan Favors Motor Mail Ca.

Prospects of the ultimate adoption of motor vehicles in the United States Postal Service to a uniform degree, are constantly growing brighter. At the annual meeting of the New York State Association of Postmasters, held in New York City this week, Postmaster Morgan of the New York postoffice, gave his personal endorsement of the motor car, and suggested its use as a solution of one of the present dilemmas of the department, which arises from the difficulty of securing prompt deliveries of periodical mail in the residence sections of the city.

"There is one class of mail matter," he said, "that should not be neglected, and that cannot be neglected without serious complaint. That is the class which includes the newspapers and periodicals. As we deliver that mail now we have to depend upon wagons. It is my opinion that automobiles should be used. Whether the automobile can be relied on for this service will be up to the department at Washington, but I believe that the automobile has reached a point of service that warrants its test as a factor in the postal service of the United States."

ROBERTS ARRIVES AT OMAHA

American Leader in New York-Paris "Race" Encounters a Protest—Rumor of Possible Change in Route.

Just what the so-called New York-Paris automobile "race" will develop into is shrouded in beautiful uncertainty. Many conflicting reports as to suggested changes in the route have been flying rampant during the past week, but it is evident that the cars mean to travel overland as far as San Francisco, at any rate. This conclusion is strengthened by the fact that when the leading Thomas car arrived in Omaha shortly before noon yesterday (Wednesday), preparations were made to resume the run to Cheyenne, this morning. Montague Roberts, the driver of the Thomas car, announced that he would pilot the car only as far as Cheyenne, Wyo., when it would be turned over to George Schuster, who has been with him throughout the trip, and to Captain Charles Hansen, the Arctic explorer, who forsook the French De Dion car after a disagreement with St. Chaffray, the driver.

Roberts got a great reception when he reached Omaha. It was, according to reports, the biggest demonstration that has been made since the cars left New York City on February 12th. The council allowed the fire whistles to be blown in honor of the American contestants, while the whole town took a holiday to view the mud-covered American car. The Italian Zust car had reached Vail, Iowa, last night, at 6.45, after a run of 89 miles through the mud. The French De Dion is still at Cedar Rapids with a breakdown, while the Prothos and Motobloc have gotten as far as Chicago.

If the Indiana snow drifts through which the cars had to be dug and pulled through was disheartening, it was at least clean, which same cannot be said of the gumbo mud that they had to wallow through after leaving Chicago, especially in Iowa. As told in last week's Motor World the leading Thomas car reached Chicago on Tuesday afternoon, followed on Wednesday by the French De Dion and the Italian Zust cars. After being wined and dined, and then all over again, Roberts left Chicago on Friday morning, 28th ult. The French and Italian crews did not have their fill of hospitality as dispensed by the Chicago motorists so they remained until Saturday morning in the Windy City.

Before leaving Chicago, however, the foreigners sprung a surprise in the shape of a protest against the Thomas car and Roberts. Among the things they claimed was that the Thomas had been materially changed while at Buffalo; that the car was towed many times, in one instance, between South Bend and Michigan City—the motor remaining stopped for two days, and the cooler removed while horses pulled the car; that the car was towed by a trolley car at one point; that the car used the railroad tracks and that it was put on sledges at certain points. The protest was signed by St. Chaffrey of the De Dion, Sirtori of the Zust, and five others. E. R. Thomas denied the first allegation, stating that the only thing changed on the Thomas car at Buffalo was the substitution of a larger gasolene tank, taking off the fenders and one of the bucket seats at the rear. Roberts issued a general denial of the other charges and said that the belated protest of the French and Italian drivers was a case of "sour grapes." He said that at no time did the motor stop running, that the car was not towed by a trolley; that it did use the railroad tracks at one time and was pulled through many drifts, but so were the other cars.

Roberts entered Iowa on Saturday and stopped at Clarence, while St. Chaffray and Sirtori got as far as Rochelle, Ill., Roberts's stopping place the night before. Dissension arose in the De Dion car before it left Chicago. St. Chaffray and Capt. Charles Hansen, the Arctic explorer, had some words and the latter left, declaring that he would take a car through to Paris anyway. Hansen's place was taken by Emanual Lescares, a Chicago Frenchman. Roberts did not lay off over Sunday but continued to Belle Plains, Iowa, 1297 miles from New York. The De Dion and the Zust kept together to Calmus. All the cars had to plough through deep mud, and naturally the going was slow. Sunday night the German Protos was reported at Chesterton, Ind., and the Motobloc at Michigan City. After eleven hours of running through deep mud Roberts succeeded in getting the Thomas car to Ogden, Iowa, on Monday night of this week, 2d inst. The Zust and De Dion cars were reported at Cedar Rapids, 132 miles behind, while a broken steering knuckle caused the Protos to stop at Chestertown, Ind., thus enabling the Motobloc to overhaul it at that place.

Another shift in positions was made on Tuesday, when the De Dion broke a spring and injured its steering gear so that it was obliged to wait at Cedar Rapids for repairs. The Zust pushed on through the trail of mud that the Thomas had left behind and got as far as Ames, 1,369 miles, that night. Roberts reported that the mud he encountered after leaving Ogden was the worst yet, but notwithstanding he managed to get as far as Logan, 1,502 miles from New York, and only 34 miles from Omaha. It also was announced on the same day that Captain Hansen had concluded arrangements with the Thomas company and would become a member of the Thomas crew at Omaha. The accident to the Protos car required it to remain idle all day at Chesterton, Ind., while the Motobloc, which up to that time had assiduously held up the rear end of the procession, passed the Protos, and chugged triumphantly into Chicago, 1,043 miles, having been twenty-one days on the road from New York. It is indeed a great automobile "race!"

There seems to be some doubt as to the future route of the contestants. It has been reported from several sources that unless the cars reached San Francisco by March 8th they would not be able to take the boat for Valdez, Alaska. Inquiry of the New York Times, failed to disclose anything definite, except that a meeting to determine the future course, probably will be held within a day or so. Another report has it that the cars will proceed overland to San Francisco, thence taking the train for Seattle, overtaking the boat there.

Non-Stop Run of 440 Hours.

After running uninterruptedly for 440 hours and 50 minutes the 28 horsepower Franklin motor car with which the Sid Black Auto Co. of Cincinnati, had been making a non-stop run, was stopped last Saturday afternoon, 29th ult.

The engine was running smoothly at the time and there was every reason to expect that the motor would continue indefinitely. One of the employes of the Black company, however, in trying to reverse the machine in the street, pulled on the emergency brake lever, set the brakes, and then threw the clutch in, stalling the engine. A minute thereafter, the engine was restarted and the car driven into the garage, the test coming to an end.

The engine was first started Tuesday, February 11, the non-stop run including actual road work each day, and idle running in the garage at night. The daily road runs averaged between 250 and 300 miles. On three successive days the car was driven to Columbus and return via Dayton and Springfield, a distance of over 250 miles. On other days it went to Indianapolis and back, to Lexington and return and to various other cities in Ohio, Indiana and Kentucky within a radius of 100 miles of Cincinnati.

Careful records were kept of the road mileage of the car, which amounted to 3,300 miles, and of the amount of gasolene consumed, which averaged about 25 gallons per day. The oil consumption was about 2¼ gallons per day. All repairs such as the replacing of one or two valve springs, putting on tires and even replacing a bearing, were made without stopping the engine. During the entire run no trouble with the engine was experienced.

Time to Overhaul the Car.

It should be borne in mind that a car which has been subjected to any great amount of use in deep snow usually requires a thorough overhauling before it is perfectly fit for summer service. The inspection incident to this overhauling should invariably include the spring mountings, steering gear, and all bolts on frame and running gear, which may have been shaken loose by the unusual strain of the winter use.

ELMORE RUSHING OUT TAXICABS

All the Present Output Booked for Chicago for Service There—Specifications of the Vehicle.

Elmore taxicabs are now being shipped from the Elmore factory as rapidly as they can be assembled. For the present the entire output is being sent to Chicago, where Mr. Owen H. Fay intends to install a taxicab service.

These taxicabs are of the same construction as the Elmore Thirty, which is the three cylinder, two cycle valveless car built by the Elmore Mfg. Co. The cab is an exceedingly light one, weighing less than 2,300 pounds. The engine develops 24 horsepower and is geared 3½ to 1, so that a speed of from 4 to 30 miles an hour is easily obtained.

THE ELMORE TWO-CYCLE THREE-CYLINDER TAXICAB

The inside height of the body is 60 inches and the inside width is 40 inches. From the front seat to the back cushion is 45 inches. The door is 22 inches wide and 54 inches high. The distance between the back of the front seat and the front of the rear seat is 27 inches and the extreme height of the body from the ground is 90 inches. Three people can be very conveniently handled in the cab, while two people have plenty of room and to spare.

The upholstering is furnished either in plain or in biscuit pattern, in either cloth or leather. Best quality of both covering material and curled hair is used. The cushions are all extra length and are built on the best quality of oil tempered springs, and like the rest of the inside are furnished in blue. Arm straps are also supplied. The doors are operated by inside latches, and both the front and the door windows are of the drop pattern manipulated from the inside. The regular color of the Elmore taxicab is dark green with a light red stripe.

The only other difference between this taxicab and the regular stock chassis is that the wheel base has been shortened so that in the taxicab it is 102 inches. This makes the car very easy to handle and it can be turned around in the average street without having to back. In the Elmore cab, which is here illustrated, the two men responsible for it, J. H. and B. A. Becker, are seated.

Official Inspection for Taximeters.

A natural consequence of the general introduction of taximeters into the motor-cab traffic of London, is the questioning of their accuracy. Failing of success in pinning the charge of dishonesty onto the coats of the drivers, the insistent public has proclaimed the dishonesty of the instruments themselves until now it has been decided that all licensed cabs must carry taximeters which have been officially inspected and sealed. The ruling which carries this clause has recently gone into effect, and a time-limit of three months has been allowed to permit the inspection of all instruments in present use. After the middle of May every taximeter in London, must bear the seal of the Physical Laboratory at Kew.

It is possible to straighten up a sagging live axle by taking up the truss rods, if such are provided, or if not, to install one or more pairs on the under side. Care should be taken in doing this, however, not to throw too great a strain on the trusses, as it is possible to bring nearly the entire load upon them, and give them more work than they are capable of fulfilling properly.

CONTRACTS INVALIDATED BY TIPS

Far Reaching Court Decision Involving the Question of Commissions Paid to Employes Making Purchases.

While the question of paying commissions to chauffeurs has been commented on from time to time, it has always been treated from the ethical standpoint and little or no attention paid to the legal phases which may be involved. A recent decision of the Appellate Division of the Supreme Court of New York State establishes an important precedent, not alone for this State, but for many others which have passed laws dealing with the subject of commissions.

On February 14, 1908, the above court, to which the case had been carried on appeal by the plaintiff, who had lost in the two lower courts, rendered a decision sustaining the judgment against the plaintiff.

The decision was in the matter of a manufacturer who sued a jobber for $1.555 due for goods ordered and accepted by the jobber, who admitted these facts. As a defense the jobber set forth that one of his employers—the buyer—had accepted from the manufacturer the sum of $75, being approximately a 5 per cent. tip or commission, in violation of the Saxe Anti-Tipping law passed by the legislature in 1905, which makes it a misdemeanor to offer a gift, bribe or commission, discount or bonus to an agent, employe or servant with intention to influence his action in relation to his principal's, employer's, or master's business. Fines or imprisonment or both, are provided as penalties.

In the case before them, the justices of the Appellant Division held that the contract was void and unenforcible because of the manufacturer's act in bribing a purchasing agent of the jobber to the end that the latter should buy the goods of the former. The decision contained the statement that a contract secured by fraud and criminal acts is void and unenforcible for that reason alone. This carried with it the unusual decision that the principal could accept and use the goods obtained and yet refuse to pay for them on the ground that the seller had been guilty of an illegal act, and one that was contrary to public policy, in inducing the sale.

The result of this decision of the highest tribunal will be far reaching, and if one or two of the cut rate, second hand dealers, who are successful in securing the patronage of a certain class of chauffeurs because of the commissions which they pay to them, find that their bills are outlawed by the very act with which they succeeded in getting the business, they will probably yell loud and long and then, perhaps, fold their tents and quietly sneak away under cover of darkness.

MODULATING SOUND TO SAVE WEAR

Startling Theory of the Relation of Noise to the Life of Parts—Its Application to Car Design.

Nothing could seem more absurd from the utilitarian point of view than the notion of "tuning" the mechanism of the motor car, exactly as a piano or an organ is tuned, with the two-fold object of modulating the plaint of its moving parts to a state of pleasing harmony, and reducing the wear to a minimum. Were it proposed to tune the parts with the single object of reducing the sound to melodious accord, the idea would appear tenable. But to speak of tuning the car, in the sense of proportioning its parts to reduce their vibration to a minimum, in order to prolong the life of the mechanism is so radical a proposition as to require demonstration. Yet such is the unique proposal offered in a paper read before the Society of Automobile Engineers by John Magee Ellsworth and Thomas J. Fay,

"Of the refinements constantly going on in automobiles there are some so far below the surface as not to attract the notice of even designers of some automobiles," is the broad introductory observation. It is a matter of common knowledge that "an attractive color" and a "noiseless performance," will do more to sell a car than "all the talk about quality of material and duplication of parts" that can be formulated by the most glib-tongued of salesmen.

The natural assumption is that these are at best but superficial criterions. Yet such is not apt to be the case as a rule. For instance, "it is not usual to discover a $1,900 body on a $900 chassis, and, on the whole a good looking body is a good sign." But the public which so insistently stipulates a good-looking body, also requires a silent performance. "Is it because the noise is more disagreeable than the noise of a trolley car, to which the public's ear has long been trained? The salesman who sees no more in this gross discrimination is still an infant in the automobile business, with the chances in favor of remaining a dwarf until the hay wagon comes to take him back home.

"The real attraction about noiseless performance is not to be rid of the noise at all, because, no sooner is the noise dismissed than a muffler cut-out is demanded, not because of utility, but to make a noise," continues the paper in question. "The real attraction about noiselessness in the performance of an automobile is quite another matter. Noise in machinery is the surest sign of a high cost of maintenance that can be read. Noise is the product of vibration, and vibration is the manifestation of the oozing life of the material, just as the tick of a watch measures the lapse of time. It is passing strange that one can learn on a page in a book that steel is subject to fatigue, that its dynamic ability is limited, that vibrations are of the greatest detriment to the steel, and turn the pages of the book, there to be told that flexibility is the desirable element in an automobile. . . . .

"To analyze sound is to investigate vibration, and since it is to vibrations we must look for the microbe that destroys the steel in the automobile, it is from the analysis of sound that some profit will be derived. . . . Sound would scarcely be a guide to go by were automobiles run in vacuo, because then the vibrations would be present without the accompanying sound to serve as a warning."

Sound manifestations depend upon the three well-known elements of pitch, intensity and timbre, expressing the number of vibrations to which the sounding body is subjected, the amplitude of those vibrations, and the quality of the tone, which depends upon the mingling of the elemental tones, or, literally, sound-color. The pure tone is the product of but a single set of vibrations; the complex tone is the product of several sets of vibrations, differing both in pitch and intensity, which combine to produce an effect which may be either harmonious or discordant according to their nature and arrangement.

Merely subduing a sound, or muffling it, does not affect the vibration which is its cause. But by so designing the vibrating element as to produce pure, or at least, harmonious sound, it is possible not only to secure an effect which is not distasteful to the ear, but also is less injurious to the vibrating body itself. For discord aside from being disturbing to the nervous system, indicates a disturbance to the molecular structure of the vibrating medium which is exactly parallel to the tremor of the distraught nerve. As the authors summarize the idea:

"Noise, as distinguished from sonorous sounds, that is to say, discords, are the most undesirable; not because the ear rebels, but for the indication of unwholesome vibrations that must in the end quench the life out of the steel. Next to the din of unwholesome noise, there are the notes, operatic treble contortions, telling of high pitch waves, with the consequent high rate of vibration per second of time.

"The real automobile (the car the purchaser asks for) goes along the road almost silently, or quite so in the better illustrations. If there is a sound 'tis the beat of the multiple of base organ pipes, and it tells a story that the owner of the car repeats, the one the echo of the other, the whole in accord. Can an automobile be deliberately designed with the idea of fixing the pitch, intensity and the 'klang-farbe?' Certainly. This is probably the reason why some automobiles are so very popular. They are so designed. They are a living example of the difference between design and contrivance. The chances are even the contrivers of cars do try to render their handiwork less noisy than they are, but, instead of going about it in a way to produce base chords, they muffle the noise as best they can.

"To make a success of a matter of this sort, it is necessary to take into account the laws that sounds obey. The propogation of sound waves follows out certain schemes of nature, the knowledge of which is essential to success. . . . .

"It would not be necessary to discuss the sound or the phenomena resulting if it were possible to prevent the members of the automobile from vibrating. To do this is to so shape them as to render them immune from vibrating tendencies. By looking into the question of the vibrations in members it may be possible to glean a clew as to the direction of minimum risk. To proceed is to divide the several members into the classes in which they will appeal to the designer, one method is as follows: (a) Cantilevers; members held at one end. (b) Members fixed at both ends. (c) Discs, circular; held at the axis. (d) Flat surfaces. (e) Tubes. . . . .

"In the automobile it will be possible to resolve nearly, if not quite, every member into the one or the other of the shapes as above set down; hence if definite information can be had in relation to the shapes involved, it will be possible to do something about the question of the resultant sound. There is one other point, i. e., the sound may be due, not to shape, but to the juxtaposition of two relating members. It may not be so much to echos that such sounds will be due, and the chances are that the broad question of accoustics will be involved, that is, sounds may be reflected, deflected, refracted, diffracted and put into interference. Under all these conditions, it is quite possible to predict that whilst the members may not (unaided) produce sounds of a nature to be condemned, the workings of the parts in juxtaposition might result in sounds not to be tolerated.

"Were it not for the fact that it is the vibrations that should be suspended rather than the noise to be dampened, the simple solution would be to 'devise the machinery so as to have it within a hermetically sealed chamber and exhaust the air.' Then there would be no noise at all."

By way of illustrating how the principles of sound phenomena may be applied to the design of the automobile the intensity of sound is considered a little more closely. "This property of sound," say the authors, "varies inversely in the square of the distance. Compressing the air or the medium, whatever it may be, increases the intensity of the sound. The intensity of sound is, of course, secondary to the fact of its production, and in that production certain laws may be taken into account.

"In tensioning members, assuming a uniform section, the effect of changes in length, section and tension will affect the sound as follows: (a)The number of vibrations in a given time are inversely as the length,

Digitized by Google

considering a constant tension. (b) The number of vibrations in a given time will be inversely as the diameter, considering a given length and a given tension. (c) The number of vibrations in a given time are as the square root of the tension, considering a constant length and section.

"Obviously, changing the material alters the vibrations, or if the molecular structure changes the number of the vibrations in a given time will change also. Here we have a fine way to note the effect of service on material, since, if the parts are investigated when new to ascertain their value in vibrations per second, the effect of time and service will be noted by the simple expedients of subjecting them to duplicate tests, from time to time. This method of investigation might also be called into play to ascertain if the parts are up to a predetermined standard, since, if the value in vibrations be not the same the material will be either different or in a different state.

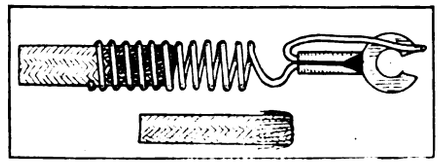
"It matters not at all, if the change is because of a difference in the micro-structure rather than the substitution of a different material, since the service might even be worse for an altered material. It was said, if the member is changed in length the vibrations would change inversely as the length. That is to say, if a member is of increasing length it will have decreasing numbers of vibrations, provided the section and the tension are held the same. By this law, one should have parts of the greatest possible length if it is the desire to have the vibrations of the least number.

"It was also said the vibrations are inversely as the diameter. That is, if the diameter is doubled, the vibrations will be halved. In this law is evidence of the fact that short, stubby parts will vibrate the least if the tension is the same. But it was said, if the tension is increased the vibrations would increase, as the square root of the increase in tension. Here is evidence of the desirability of holding to a low tension in pounds per square inch of section, or what amounts to the same thing, a low tension in proportion to the static ability of the material.

"On the whole, then, these laws cry for conditions as follows:

"(I) If the length of a member is short, it should have a considerable sectional area in all planes subject to vibration, to hold the latter as low as possible.

"(II) To hold the vibrations as low as possible the section should be great, no matter what the length.



"(III) The static ability of the material should be very great in proportion to the static load. This dictum stands for other reasons, as for illustration: The dynamic life (expectation) depends not only upon the number of the vibrations per second of time, but upon the extreme fiber strain to which the member is worked during the period of vibration. . . . .

"It is the bell, the tube, the sounding board, and the tuning fork phenomena that are responsible for the sounds and the noise alike in the automobile. Eliminate the bell, abandon the clapper, put kinks in the sounding board, shorten the tube, and stiffen the tuning fork, and the automobile 'will fold its tent like the Arabs and as silently steal away.'"

Terminal Connection with a Spring.

One of those ingenious little devices which appears well worth while and which has had practical usage and serves practical purposes, is the terminal connection for battery, spark plug or coil, which just has been patented by Harry Read, an automobile engineman in the employ of the department of street cleaning of New York City.

The intention of the inventor was to produce a flexible terminal which would overcome the frequent annoyance caused by the

breaking of the wire, due to vibration. This has been accomplished by the use of a spiral spring. But additional features have been added by bringing the straight end of the wire, of which the spring is made, around by the side of the slot in the terminal where it serves to keep the nut tight by pressing against it. This end serves the additional purpose of being available for insertion in the hole in a dry battery pole where provision is made for only this form of contact.

Not the least original of the ideas incorporated in the Read terminal is the method of attaching it to the wire of either the primary or secondary circuit. Having removed the insulation, the bared wires are simply spread back over the outside of the insulated wire as shown in the illustration; the coiled spring can be screwed on, the insulated portion of the wire over the bared ends, thus securing a relatively large area of contact surface and obtaining a practically permanent connection without the use of solder, as any strain on the spring serves to contract its diameter as it is lengthened, in this manner a tight connection, which yet may be readily removed, is possible.

Proper Use of Wrenches.

One of the great temptations when giving a car a general overhauling, or even when only one or two loose nuts need tightening, is to resort to a convenient monkey wrench, as this tool is quickly adjusted to take either the large or small nuts. But there is danger in doing that sort of thing as the purchase which is obtained when a ten or twelve inch wrench is employed is far in excess of that which is needed for properly tightening a small nut and it is a difficult matter to make proper allowances for this purchase so that the bolt shall not be twisted off. A better plan is to have at hand an assortment of solid or S wrenches, as these are designed to the end that their length will be proportionate to the amount of the strain which should be put on the nut that they are made to fit, and it is a rare occurrence to destroy a bolt when one of these is used, unless the very purpose of the wrench is defeated by the use of a length of pipe, to obtain a greater leverage, being put on the wrench.

History in a Maxwell-Briscoe Souvenir.

"Faith and Its Realization, the Story of an Industrial Accomplishment," is the title of a new publication of the Maxwell-Briscoe Motor Co. The book gives an interesting history of the beginnings of the new factory of the company at Newcastle, Ind., and chronicles and illustrates the ceremonies of the corner stone laying. Value is added to the book by the reproduction of the speech delivered on the occasion by Vice-President Fairbanks, who, himself a native of the State of Indiana, laid the corner stone and made an eloquent address dealing with the rapid development of our national industries and the solution of national problems.

Don't Use Pliers on the Spark Plug.

While it is desirable that the contact between the spark plug and secondary terminal should be as secure as possible, it is unwise to resort to pliers for the purpose of tightening the binding nut on top of the plug. When tools are used to make this connection secure, it frequently happens that the porcelain is broken or that the entire core of the plug is turned, so that the distance between its sparking points is sufficiently altered to effect the travel of the spark so that it is forced to jump more or less than the 1-32 which is usually the required distance to obtain the best results.

One of the Cold Weather Precautions.

A rare, though possible accompaniment of cold weather arises from the collection of an undue amount of moisture in the air-pipe leading from the engine to the fuel tank in a car equipped with the pressure system of carburetter feed. The result is a choking off of the pressure line, either partial or complete, which occurs after the car has been permitted to stand in the cold for some little time. Where it is impossible to disconnect the piping handily, the most obvious and satisfactory remedy is to swathe the line with cloths wrung out in hot water.

Garage Crap Game Raided.

The garage of the Roseville Motor Co., at Orange and Fourteenth streets, Newark, N. J., was raided by the police at 4 o'clock Saturday morning last. The police found nine men "shooting crap" and each was fined $10, when later arraigned. None of the men arrested were employed at the garage, however, entrance having been effected by a chauffeur who had a car stored there.

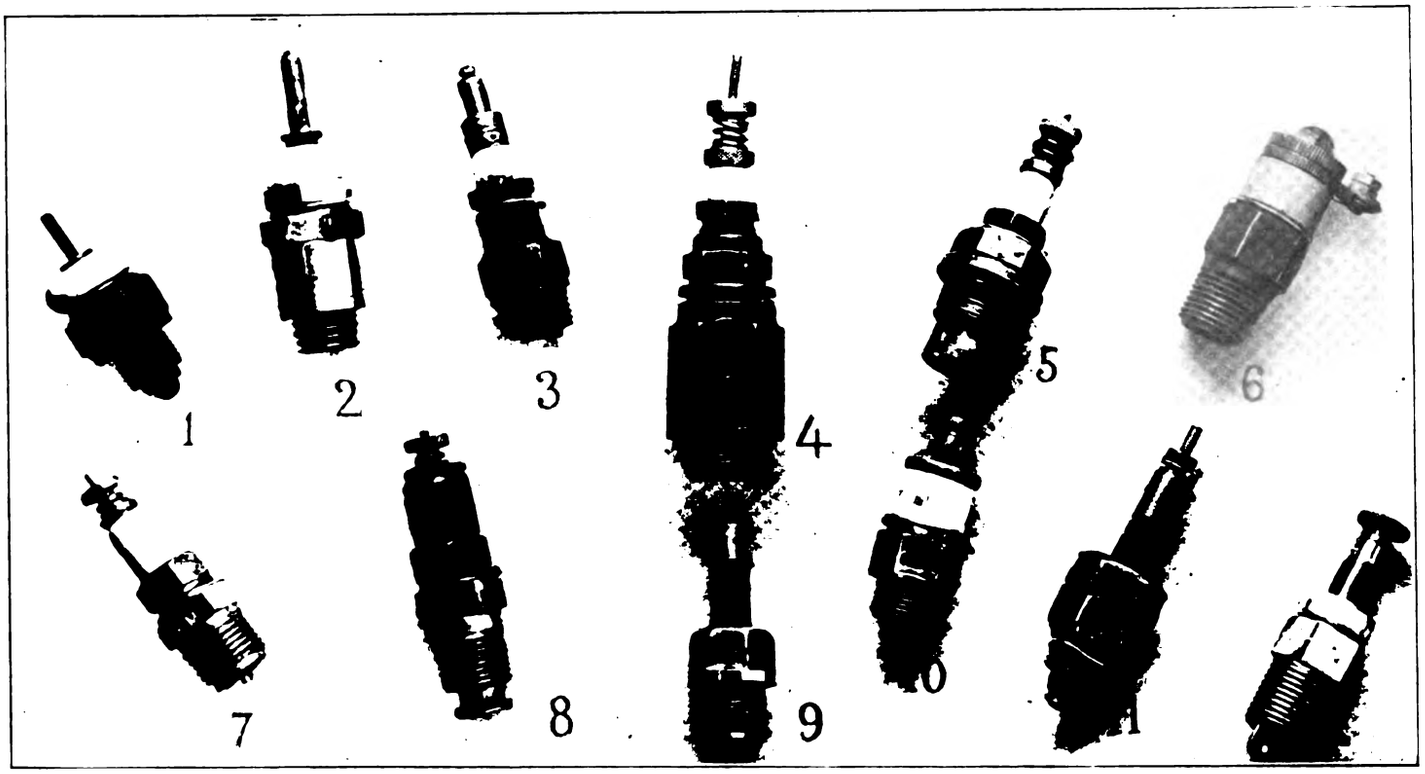
DEVELOPMENT OF THE SPARK PLUG

Refinement of Construction without Radical Change of Form—Old and New Types and Their Features.

While there is little resemblance in the gas engines of to-day to those of six or seven years ago, the same statement cannot be made in reference to the spark plug, which, despite considerable refinement, retains the same general form and construction that it has had from the beginning.

Since the earliest days of the jump spark there has been almost no change in the principles of the plug. Though the first models were frequently found with two or three bushings, a gasket or two and occasionally some device or contrivance for injecting a priming charge into the cylinder through the plug, the general principle of a core and base, so arranged that the spark jumped from the former to the latter, was, in effect, the same then as it is now. While this principle has been carried out in a great number and variety of ways, the changes have merely been in some small and unimportant detail, which has had no bearing on the general shape of the plug itself, but has served only to carry out the theories of the makers.



Dividing into groups the plugs shown in the illustration, it is seen that the group consisting of Nos. 1, 2 and 3, have a center core of porcelain, through which is carried the terminal. The plugs Nos. 1 and 3 are obsolete French types which found favor in 1900-01. The former known by various names in this country, is possibly best remembered as the G. C. S. Bougie; the core of it is much like a cylindrical metal ball, while No. 3 is the early De Dion, of which there were many imitations; the terminals in this were short curved wires. No. 2 is a plug that is well known on the other side of the pond, and which has found some favor on this. Like the other two in the group this "Pognon exporta" has the wire terminal incased in porcelain, the features of it being the so-called hollow, or cup, porcelain that permits of a greater sparking surface. The Pognon presents an unusual appearance because of the great amount of metal used in the base; in this respect it is entirely unlike any of the others in demand at this time, as the general tendency is toward compactness.

No. 4, the "Non-Stop," is the invention of A. W. King, at one time interested in the manufacture of the Gasmobile. This plug which appeared in 1902, is entirely different from any that have been offered for public use. Large and cumbersome, it was constructed to contain a firing chamber into which a priming charge could be easily injected through a pet cock screwed into the hole in the lower shell. An idea of its size may be obtained by comparison with the plug pictured beneath it, a modern "Jewel," the whole of which barely equals in length the distance from the bottom to the lowest hexagon nut of the larger plug.

The two others on the top row, Nos. 5 and 6, represent types in which the center core differs from many because of its shape; in the former a pear shaped metal extends to a point near the circular metal band which is mounted on the body of the plug, the point of the pear serving as the terminal from which the spark jumps. This plug is rarely if ever seen now. No. 6 is the well known Herz, unusual in shape and having a distinguishing feature in the substitution of stone or lava in place of porcelain. The electrode in this plug is round and occupies nearly all of the base to which the spark jumps from a slight projection on the core.

Two entirely modern and well known plugs, the "Miller" and "Spitfire," Nos. 7 and 8, respectively, serve to illustrate different ways of working out the same idea. The claim for both of these is that they can not be fouled by carbon deposits or short circuited by oil. In the Miller plug the results are obtained by retaining for air space the entire interior of the base. The porcelain insulation comes only to the top of the shell where it is secured by a bushing; no insulation is in the base, the terminal of heavy wire being sufficiently rigid to retain its position. The other plug, the "Spitfire," is much like this in that a large area of air space is retained, the difference being that a hood or cap offers the surface for the grounding of the plug. A characteristic of this plug is a fiber shield to protect the porcelain.

The "Jewel," No. 9, needs no description. Its reproduction here serves to dem-

OLD AND NEW TYPES OF THE SPARK PLUG

Digitized by Google

onstrate the simplicity of present construction in contrast to the productions of a few years ago when a quantity of body metal was surmounted by a series of bushings, gaskets and even springs.

The last three plugs depicted are of interest because of the introduction of a different principle. In No. 10, the core is hollow and contains a valve seat into which a ball is forced by the compression stroke of the piston; on the suction stroke air is taken in through the core, the object being to correct the mixture by the additional air which also serves to keep the contacts clean. This plug, known as the H. M., did not attain great popularity, and soon after its introduction in 1905, was withdrawn from the market.

The other two of this group, Nos. 11 and 12, are examples of a vibrating plug first introduced this year. No. 11 is the original model from which the other has developed. This plug consists of three parts, the base, the bushing and the core. The core is the usual form employed in mica plugs, but has a brass tubing, with a shoulder, incorporated in it. In the bushing is a valve seat into which the core shoulder fits; the suction and compression strokes of the engine piston keep the plug core in rapid movement and by this movement carbon deposits are prevented.

With the exception of the vibrating plugs and the mammoth No. 4, all the plugs shown in the illustration are practically alike, save for the slight differences which have been described.

Odd Substitute for Valve Spring.

The "mother of invention" is responsible for many happy solutions of difficulties which might have caused almost endless annoyance. This was recently illustrated when a motorist suffered the inconvenience of a broken intake valve spring while on a country road, far from repair shops or stores, where material for temporary repairs could be obtained.

Though the mishap was small in itself the consequences were annoying as one cylinder was effectually crippled by the break. But the difficulty was there and the means for overcoming it at hand. When the fertile brain, spurred by the prospect of a delayed trip, suggested the use of a piece of spiral spring such as could be obtained from a window shade roller. At the first house the ownership of the interior mechanism of a window curtain changed hands for a slight consideration, and after cutting it to the proper size for its new use, the ingenious motorist went on his way rejoicing.

Doubles Output of Alumaloyd Sheets.

Since the Stark Rolling Mills Co., Canton, Ohio, added alumaloyd sheets to their productions, the capacity of that department has been doubled. The material found an almost instant demand from the automobile trade.

ABOUT CHOICE OF LUBRICANTS

Meaning and Importance of the "Flash Test" and "Viscosity"—Why Mineral Oils are the Best.

It is a safe assertion that at least 99 out of every 100 motorists give time and thought to the questions which arise in the selection of the various accessories with which they equip their cars. If a speedometer is wanted, it does not follow that the first one which may be suggested will be bought, but rather that an investigation into the merits of the different ones will be made, and that which is finally selected will be the choice because of certain qualities which it possesses that appeal to the purchaser who thinks it the one best adapted to either his use or his pocketbook—and the price is not always the determining factor.

This same reasoning and investigation is applied to all the other minor parts of his equipment whether it be spark plugs or storage batteries, clocks, tops or wind shields. And yet one of, if not, the most important of the supplies which have to be bought is selected without consideration or intelligent inquiry as to its merits and is used with an absolute disregard of its possible effect on the power plant, and that is the lubricating oil.

The motorist may say that he is helpless in the matter of selection of a proper lubricant; and to a certain extent this is true. It is very probable that little meaning would be conveyed to him if he was told that a certain oil had a "flash" of 425, and as for the word "viscosity," it suggests something remote, if it suggests anything at all.

But, as an actual fact, does the average automobilist know the difference between a babbited bearing and one made of white bronze? Can he tell which is preferable? Does he know anything about the r.p.m. of his flywheel, or care? And yet before the purchase of a car is made, catalogues are conned, friends interrogated, and every precaution is taken to get the best that can be found within certain limitations.

But the question of a proper oil rarely is considered. The agent says get the P. D. Q. brand; a friend suggests something else and the bewildered owner tries both, though neither may be entirely suited to his particular type of car.

The essential point in the lubrication of an automobile is to have an oil that will be consumed by the heat generated in the cylinder, and at the same time, be high enough in flash so as not to be consumed too quickly. If it is too high in flash, the result is distillation, which leaves behind a heavy deposit that becomes carbon and causes the trouble that motorists are familiar with. In a water cooled cylinder this is very apt to occur, as the walls of the cylinder are comparatively cool.

"Flash," it may be well to explain, is the temperature at which the vapor from the oil will ignite, and when the expression "425 flash" is used it signifies that the vapor from the oil will be ignited at a temperature of 425 degrees Fahrenheit, and incidentally this is just the test that is most desirable in the lubrication of a water-cooled engine. In the air-cooled cylinder a different condition exists, as the much higher temperature to which the cylinder walls are heated would at once consume an oil that would serve perfectly in a water-cooled machine, and the destruction or consumption of the oil would occur before it had performed its lubricating functions.

In seeking a proper lubricant, care should be taken to obtain an oil which will not "gum" or cause corrosion or oxidation. Oils containing a large amount of animal matter should be avoided as the action of the animal oils on metals is deleterious unless all the fatty acids have been extracted, and where it is used for splash lubrication the oil is apt to saponify, making a clotted mass in the crank case far too dense to permit of a sufficient portion of it reaching the bearings and cylinder walls. Animal fats have no special value as lubricants, as compared with mineral oils, and the use of them simply increases the cost without adding to their efficiency.

Where animal oils are used there is little benefit derived, as these contain oleic and stearic acids and quickly form a soapy mass when beaten or churned by the crank. As an engine lubricant they are almost an utter failure and have the additional bad feature of deleterous effect on the metals.

If consumers would obtain the oil best suited for their purpose, inquiry at any oil dealer's would result in getting a mineral lubricant with a flash test of about 425 degrees for the water cooled cylinder, or from 475 to 525 for air cooled, and which is not to viscious or dense. Animal and most vegetable oils should be avoided for reasons already stated.

Melancholy Sequel to a Merry Ride.

It was a merry automobile ride that Charles Clark and Edwin Stuetlich took the other night in Milwaukee in a stolen automobile, so the police say. Clark went to the beer city some time ago from the East, to perfect himself in the knowledge of automobile parts manufactured by the A. O. Smith Co. While feeling festive, it is charged, Clark, accompanied by his friend Stuetlich, broke into the factory by smashing a door, took out an automobile and raced recklessly about the city. Next morning the car was found abandoned. In passing sentence Judge Neelan remarked that Clark might spend the next ninety days gaining useful information about the construction of chairs. Sentence was suspended on Stuetlich.

LIGHT ON "UNIVERSAL LIGHTS" LAW

Massachusetts Legislative Committee Hears Arguments in Its Favor—Horse Drivers and Automobilists Agree.

Much light was shed on the question of requiring all vehicles to carry lights at night during a hearing given by the Massachusetts legislatve committee on roads and bridges on the 25th ult. The Massachusetts State Automobile Association, the Bay State Automobile Association, the Safe Roads Automobile Association, the Automobile Owners' Association and several of the leading automobile clubs in the State had representatives at the capitol in Boston, and there were present, also, an anti-automobile element represented by General Luther Stevenson of Hingham, who said he appeared in behalf of nine-tenths of the people of the Commonwealth who want more stringent regulation of motor vehicles. He read a long dissertation on the evils of the automobile.

While the hearing was intended to cover several of the automobile measures pending in the legislature the greater portion of the time occupied was given to the two "universal lights" bills. The codification measure was left until late in the session, at the suggestion of Colonel William D. Sohier, president of the Safe Roads Association, who made the suggestion with the view that any codification which is made can include amendments made this year. The two bills relating to number plates also were deferred on the representation of Colonel Sohier that a new bill had been drafted to cover the carrying of numbers on cars from outside the State, substantially as required of Massachusetts cars, and the proposal to make it a heavily punishable offense to drive a car without its number.

Of the "lights" bills, one entered by E. WentworthPrescott was taken up first. In advocating the proposed legislation Mr. Prescott related his experience in driving a horse and carriage, and said that he had had one collision and numerous narrow escapes because he was unable to see other vehicles using rubber tires. In his opinion the passage of the bill is necessary as a protection to life. There are often accidents caused by fire trucks running down carriages which cannot be seen on the roads. Automobiles are required by law to carry lamps, and other vehicles ought to be compelled to do the same for the protection of their owners and occupants. Mr. Prescott said he thought the Safe Roads Association bill would cover the point better than his measure.

Colonel Sohier thought it would be difficult to require that the light be seen in all directions; the term "visible" would seem to be a sufficient requirement. In most of the country districts the farmers generally carry lanterns at night hung under an axle, but the few teams without lanterns are the ones that cause trouble.

Elliott C. Lee, president of the Massachusetts State Automobile Association, favored having the light so placed that it could be seen both from front and back. In Europe it is required that the light be carried on the side. He stated that the State Association has voted in favor of the "lights" bill. Ex-Representative Charles J. Weir, as legislative counsel of the State Association, said that it is not the desire of the petitioners to put a hardship upon anybody. The burden of preventing accidents is now put entirely upon the automobilists who have to carry, in order to protect themselves and others, acetylene lights in addition to the small lights required by law. In his opinion the majority of the farmers now recognize the necessity of carrying a light on their wagons. Mr. Weir said he saw no need of requiring lamps on sleighs. Colonel C. L. Young of the Springfield Automobile Club brought up the question whether the bill would interfere with the present automobile law regarding the carrying of lamps on motor vehicles. He thought that the two should be made uniform so that the farmers will not have to light their lights any earlier than the automobilists. He thought that lights should be required from an hour after sunset until an hour before sunrise. Francis Hurtubis, Jr., in behalf of the Automobile Owners' Association, spoke briefly in favor of permitting the highway Commission to fix the place where the light shall be carried. In answer to questions by Representative Cook, Mr. Weir said that if the bill were passed the farmer without a light who was run into would have more trouble than at present in collecting damages.

Among others who spoke in favor of the bills was Vice-President L. R. Speare, of the American Automobile Association and chairman of the legislative committee of the State Association, who said that from talks he has had with farmers he had formed the opinion that most of them recognize the value of carrying a light. Dr. V. J. Irwin of Springfield, a driver of horses, said he favored the bill for his protection. Dr. Walter G. Chase called attention to the fact that in every civilized country vehicles are required to carry lights at night. Even in Malay states, where bullocks and cars are the principal means of locomotion, the carts must carry lights.

Speedway Talk at Salt Lake.

Salt Lake automobilists are interested in the proposition to build an exclusive automobile speedway between that city and Salt Air, a nearby pleasure resort. The road would be 15 miles long, 12 miles of the distance in a straight line. Although no details have been made public it is reported that the resort management and the local railway company are both interested in the proposition.

WILL RESIST DOUBLE TAXATION

Jersey Dealers to Oppose the Frelinghuysen Bill—If Enacted Its Constitutionality Will be Tested.

So far as the tradesmen of New Jersey, represented by the New Jersey State Automobile Dealers' Association, are concerned, there will be no more useless and long-winded debates with Senator Joseph S. Frelinghuysen looking toward a moderation in the proposed amendments to the New Jersey automobile law, contained in the bill introduced by Senator Frelinghuysen. These amendments consist of a sliding taxation of vehicles based upon horsepower, from $3 to $100 per year; a sliding scale for drivers' licenses, from $1 to $25; the granting "admission tickets" to non-resident motorists to use New Jersey's roads, at a cost of 50 cents per six days, and the abolition of manufacturers' and dealers' blanket licenses, besides several other minor changes.

That there will be no more conferences in regard to modification was shown Friday afternoon last, 28th ult., when the dealers held a meeting in Newark and decided to test the constitutionality of the licensing clause, if enacted.

The meeting of the trade association was an animated one and a resolution attacking the constitutionality of the proposed act was unanimously indorsed and a plan of battle decided upon. The meeting was attended by a majority of the members, all of whom were determined in the stand taken by the association. The resolution says that the association is unqualifiedly and unalterably opposed to the high, prohibitive and inequitable license fees proposed, and will seek the necessary funds by combining with the various automobile clubs of the State to test the constitutionality of the double taxation proposed under the form of license or registration. The resolution is as follows:

Resolved, That the New Jersey Automobile Trade Association, meeting in conference for further discussion of proposed amendments to the automobile law, is unqualifiedly and unalterably opposed to the high, prohibitive and inequitable license fees proposed, and that whatever funds be necessary to subscribe to the end of securing their defeat is hereby authorized. It is further

Resolved, That the New Jersey Automobile Trade Association combine with the various automobile clubs of the State and test the constitutionality of the double taxation proposed under the cloak of license or registration. That it is the opinion of this association that the constitutionality of this principle be tested in the highest courts, and that every effort be made to put automobilists on the same footing as every other user of the highways. Further, that this association is opposed to any change in the administration of the department, and that every economy should be practised and the department not be made a political ma-

Digitized by Google

chine to be used for political purposes. Also, that this association is in favor of a law requiring all vehicles to display lights at night, and that every influence be brought to bear to secure the enactment of such legislation.

R. A. Greene and W. H. Ellis of Newark, and George Blakeslee of Jersey City, were appointed a committee with full power to act, to confer with representatives from the associated automobile clubs of the State, to the end that a reasonable law be enacted which will meet with the approval and respect of every automobilist, resident and non-resident, using the highways of the State. The tradesmen will seek the aid of the Boards of Trade throughout the State in its fight.

The action of the dealers was made on the principle that the State should not exact from the automobilist in license fees more than is absolutely required for the carrying on of the work of the automobile department, certainly not a tax intended, in part or as a whole, for the maintenance of the State road system. This and other kindred points will come up for discussion at a meeting of representatives of the various associated automobile clubs of the State to be held at the New Jersey Automobile and Motor Club in Newark on Friday night of this week, 6th inst. Senator Frelinghuysen, father of the existing New Jersey automobile law and author of the proposed iniquitous amendments, has promised to attend and will doubtless learn just how "high" in the esteem of motorists he is held.

That the meeting will not be one for compromise, is made plain by the officials of the New Jersey organization. They emphatically state that they have abandoned the policy of concession and compromise which has governed their action for the last two years, and will make use of every power at their disposal, political as well as otherwise, to make their influence felt. The action of the dealers in passing the resolution is fully approved and concurred in by the Newark club, and it is thought that all the other clubs in the State will use every influence to prevent the passage of the proposed Frelinghuysen amendments even if they are reported from committee.

The North Jersey Automobile Club, which has its headquarters in Paterson, also has officially gone on record as opposed to the Frelinghuysen amendments, but the Patersonians imply a willingness to compromise, as evidenced in the following resolution, passed at the last meeting of the club:

Be it resolved, That the North Jersey Automobile Club strenuously opposes the automobile bill and its proposed amendments politically and legally, unless we can obtain the following changes: A reasonable speed limit; reciprocal privileges to foreign automobilists; elimination of the persecution by constables and justices of the peace.

It is evident that the fight against unjust legislation as practiced upon automobilists in New Jersey is not going to be a half-hearted affair, as it has been in the past. New Jersey numbers several thousand influential citizens among its motorists, and their inuuence with members of the legislature doubtless will make itself felt if the aggressiveness which already has been manifested is continued in the fight against unjust automobile legislation, and there is no reason to expect a change in attitude.

Automobile Freight Line Project.

An automobile freight company to operate between Camden and Atlantic City, N. J., is said to be in progress of formation, following the successful inauguration of a similar service by a large Camden concern which does considerable business with Atlantic City. As yet the names of the backers of the new project have been kept in the background. It is declared that the Camden firm saves $60 on every load of goods it sends to Atlantic City, over what it would cost to send the same merchandise by railroad or trolley, and it is this fact which has prompted the formation of a regular express service between Camden, which virtually would mean Philadelphia, and the seashore resort. In view of the hard, level roads all the way between Camden and Atlantic City, there is no doubt of an automobile express service being possible.

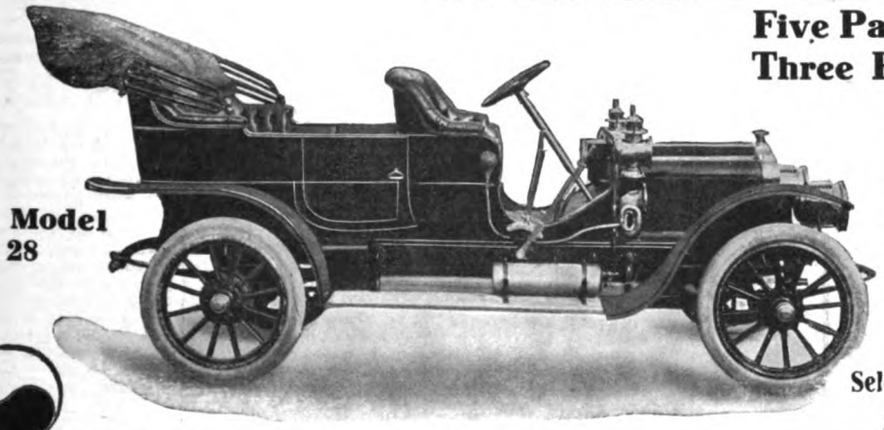
Automobilist Scores a Legal Point.

The question whether an automobile is a road vehicle in the ordinary acceptation of the term has arisen in one of the Pennsylivania courts, and an opinion has been handed down which, as far as it goes, is in contrast with the recent decision of the Massachusetts Supreme Court, denying that roads must be made safe and convenient for automobiles. W. W. Scranton is prosecuting a suit having as an ultimate object the opening to automobiles of the Laurel Run turnpike, the action having been filed in the court at Wilkes-Barre.

Mr. Scranton was refused the privileges of that road while driving a car from Scranton to Wilkes-Barre and his action is based on that refusal. The turnpike company in replying to his bill of particulars averred that the automobile is a vehicle not available for the road; that the turnpike was not built for motor machines, and that an automobile is a conveyance not generally used, and much different from a carriage to which horses are attached. Scranton met these averments by the contention that they are immaterial, improper and impertinent. This view was taken by Judge Lynch, who handed down an opinion on the 27th ult., ordering the averments stricken from the answer.



Mail Carrier's Profitable Automobile.

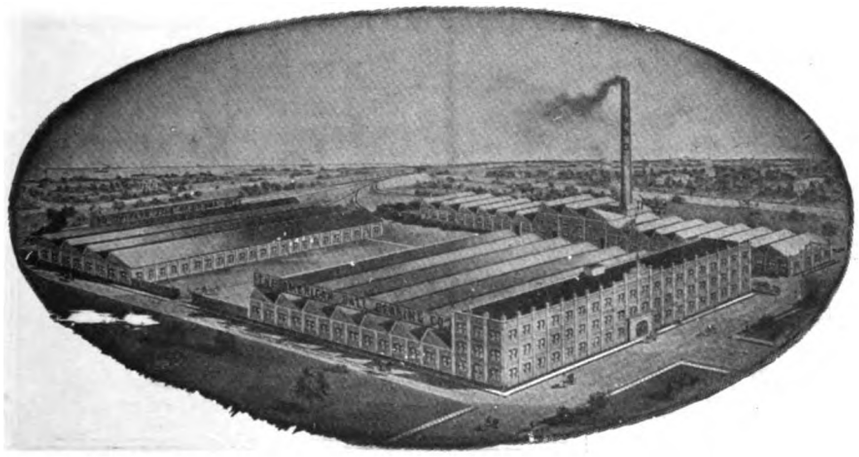
Emporia, Kan., has a motoring mail carrier in the person of George E. Mays, who covers a 27-mile route leading out of the city. Mays began carrying mail in 1894, and the high prices for horses and feed and the expense for buggies and harness led him to think of the automobile. Securing permission from the authorities at Washington, Mays purchased a runabout, and has been using it successfully in the delivery of mail. With horses it formerly took him from six to seven hours to cover his route; now, three hours is sufficient. He has kept tabs on running expenses and states that 30 to 35 cents for gasolene and oil per trip is all that it has cost him. After the mail is delivered each day Mays uses his car for livery purposes, thus adding materially to his income.

Quick Work in Mail Delivery.

Practical demonstration of the value of the automobile for mail service was made last Saturday, 29th ult., by James Miller, Jr., who covers the West Hartford rural free delivery route, in Connecticut. Miller's route is approximately 22½ miles in length and the average time required for covering it is about five hours. On Saturday morning Miller started out with a small runabout, and was timed by Postmaster F. M. Buckland. He had to make a larger number of stops than usual on account of a flood of advertising postal cards, the total of stops at mail boxes numbering 190. The time occupied was 1 hour and 55 minutes. Much of the highway traveled was rough and icy. Miller's outfit includes two horses and he thinks of making a permanent change to the automobile, estimating that not only would the cost of gasolene, oil and ordinary repairs be less than that of maintaining his horses, but unusual repairs and wear would be offset by the occasional loss of one of the faithful but hard worked animals.

THE SELDEN CAR

Model 28



Five Passenger Touring Car $2000
Three Passenger Runabout $2000

AN ATTRACTIVE CAR AT AN ATTRACTIVE PRICE

SPECIFICATIONS—Engine, 4 cylinders, 4¼x4½, 28-30 brake horsepower. Transmission, 3 speeds forward and reverse, selective, Timken bearings. Wheel base, 109 inches; tread, standard; clutch, cone leather. Body, sheet metal, straight line type, roomy and comfortable. Tires, 32x3½, quick detachable; make optional. Frame, pressed steel, 4¾ inches deep. Front axle, single I-beam drop forging, ball bearings. Rear axle, bevel gear drive, enclosed type, roller bearings. Ignition, synchronized jump spark. Weight, empty, 2,200 lbs. (actual, not catalogue).

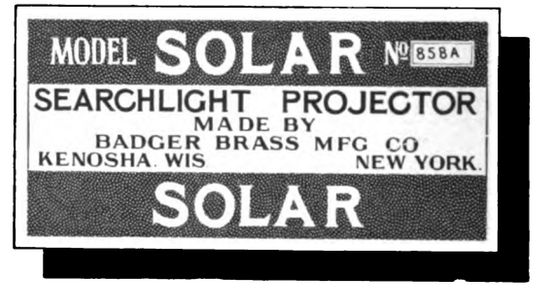
Zerolene, the new carbon-proof, frost-proof, *trouble-proof* oil, does away for once and all with every uncertainty and mistake of automobile lubrication. **Zerolene** leaves practically no deposit of carbon in cylinders or on spark plugs. This oil is produced in only one place in the world.



ZEROLENE

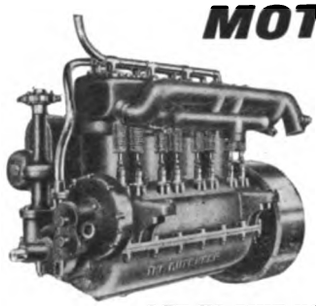
Auto-Lubricating Oil

is the *only* oil that is suitable alike to all gasoline engines and all temperatures. It "works" freely and reliably in zero weather or in midsummer heat. **Remember, there is only one grade of Zerolene.** This one grade will give perfect service in every gasoline engine regardless of type or season. It is put up in sealed can, with patent spout that prevents **non-refilling.** This non-refilling feature protects you from damage by substitution of inferior oils. **Zerolene** is also put up in barrels for garage trade. Sold by dealers everywhere.

Remember this label and the protection of the non-refilling can.

STANDARD OIL COMPANY
(Incorporated)

THE SOLAR NAMEPLATE



on a lamp or generator is a POSITIVE GUARANTEE to the user that he has the BEST in lighting equipment.

Solar Lamps have more brass—less solder—and riveted parts; therefore more durable. Fewer parts—therefore more simple in construction. Special Bausch & Lomb mirrors—and each lamp tested as to accuracy of focus: therefore better light. Specify Solar—the **standard** lamp of the automobile.

Triumph Grease, What Is It?

¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

The Perfection Grease Company, South Bend, Ind.

The Week's Patents.

875,542. Tire Valve Stem Protector. Charles W. Lurtey, Little Rock, Ark. Filed May 15, 1906. Serial No. 316,900.

The combination with a tire having inner and outer sections, of a valve stem machanism projecting from the tire, and a stem protector comprising a base plate that is located between the tire sections, said plate being longitudinally and transversely curved, and an open ended sleeve projecting from the base plate and from the tire and surrounding the projecting portion of the valve stem.

875,556. Vehicle Fender. Jacob L Schureman, Chicago, Ill., assignor to Appliance Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 21, 1907. Serial No. 358,616.

1. A vehicle fender comprising, in combination, an impact bar, supporting rods connected with said bar, guiding supports adapted to be secured to the sides of a vehicle and in which said rods are guidedly supported between their ends, cushioning means for the bar interposed between it and said guiding supports, and guide brackets adapted to be secured on opposite sides of a vehicle and having elongated guide slots in which the rear ends of said rods are removably confined.

875,693. Vehicle Spring Check. Herbert Cottrell, Newark, N. J. Filed Jan. 9, 1907. Serial No. 351,410.

1. A vehicle spring check, comprising a longitudinally divided clamping case, adapted to be attached to vehicle body, and to be adjusted in clamping frictional contact with an internal cylindrical crank hub provided with circumferential wedge rings upon its surface, and a lever arm and connecting rod, to attach to lower spring or axle; to resist rapid spring compression or extension; substantiall as described.

875,716. Carburetter for Explosive Engines. Adele A. Longuemare, Paris, France. Filed Nov. 11, 1905. Serial No. 286,878.

1. In a carburetter the combination of an atomizer for the fuel, a choke tube surrounding the atomizer, said choke tube comprising the frusta of two hollow cones connected by their smaller ends, a valve seat formed by the base of the lower frustum, a supplemental air valve adapted to fit the valve seat on the choke tube, an inclosing casing surrounding the air valve, a helical spring arranged between the top of the valve and the casing and adapted to press the valve upon its seat, said spring being capable of being overcome by a reduction of pressure within the casing, and means for controlling the movement of the valve substantially as set forth.

875,726. Vehicle Wheel and Tire Therefor. Valentine H. McDowell, Lynn, Mass Filed Sept. 14, 1906. Serial No. 334,641.

1. An elastic tire adapted to contain air, and provided with a plurality of clencher engaging flanges separated by a space at each edge of its base portion, the body of the tire and said flanges being reinforced by continuous textile fabric embedded therein.

875,759. Shock Absorber. Lawrence Whitcomb, Brookline, Mass. Filed July 10, 1907. Serial No. 383,044.

1. In a shock absorber, in combination, a hollow member capable of being attached to the vehicle spring or axle, a co-operating member with said hollow member, cork inserts in one of said parts, an expander, a threaded rod secured to said expander, a threaded sleeve or nut adjustable on said threaded rod and engaging said co-operating member to limit the movement of said expanded and thereby regulate the pressure of said co-operating member, substantially as described.

875,766. Vehicle Attachment. Frank R. Allen, Passaic, N. J. Filed May 15, 1907. Serial No. 373,736.

1. In combination with a vehicle body, and the running gear thereof, strips secured to the under side of said body, tracks secured to the running gear and being disposed in vertical alignment with said strips, and guiding members each having a horizontal portion between said strips and tracks and a downwardly and inwardly extending part engaging the top, side and bottom faces of said tracks.

875,800. Friction Clutch Pulley. John Gilson, Port Washington, Wis., assignor to Gilson Manufacturing Company, Port Washington, Wis., a Corporation. Filed May 11, 1907. Serial No. 373,061.

1. In a friction pulley, the combination with a rotatable shaft, of a clutch member fixed thereon and having a hub and friction disc, a bolt loosely engaging the hub at one end and threaded at its other end, a second clutch member slidable upon the outer end of the hub and rotatably engaging the bolt,

a pulley loosely mounted on the hub of the fixed clutch member between the friction disc and slidable clutch member, and a nut adapted to move the slidable clutch member against the outer end of the pulley.

875,892. Mechanical Movement. Tracy V. Buckwalter, Altoona, Pa. Filed March 21, 1907. Serial No. 363,558.

1. The combination of a shaft, a wheel, a universal joint having a pivotal connection to said shaft and a pivotal connection within said wheel, a wheel movable about an axis transverse to said shaft, and means for connecting said wheels so that one is driven from the other.

875,907. Sparking Device. Benjamin G. Gilbough, Chicago, Ill. Filed Dec. 26, 1906. Serial No. 349,554.

1. In a sparking device, the combination of a tubular plug adapted for connection with an engine cylinder, a cylinder mounted thereon and in communication with said plug, a piston movable in said cylinder and having a stem projecting beyond the outer end of the cylinder, a vibratory electrode extending into said tubular plug, an actuating member for said vibratory electrode, and a pawl connected with said actuating member located in the path of the piston-stem, whereby the piston serves during its outward movement to move said actuating member through the medium of said pawl, the pawl being so arranged with relation to the piston stem as to be released to permit said actuating member to return to its normal position when the piston reaches the outer end of its traverse.

875,942. Acetylene Lamp and Lighting Device for Automobiles and Other Vehicles. Svend M. Meyer, New York, N. Y., assignor to George Clinton Batcheller, New York, N. Y. Filed Dec. 21, 1905. Serial No. 292,852.

1. An acetylene lamp and self-lighting system for vehicles comprising an acetylene generator and an electric battery mounted together in a connecting frame; a series of suitably arranged lamps, conductors connecting from the battery to the several lamps and a switch closing the circuits through the several lamps for lighting selected lamps at the will of the operator, subtsantially as described.

875,991. Air Cooling Apparatus for Explosive Engines. John E. Gilson, Port Washington, Wis., assignor to Gilson Manufacturing Company, Port Washington, Wis. Filed May 16, 1907. Serial No. 374,056.

1. An explosive engine cylinder, a rotary fan supported in connection with the cylinder parallel to same, and a circular casing for the fan having a hood extension inclined inward toward the axis of said fan beyond the cylinder head.

875,994. Tire. William D. Harris, Philadelphia, Pa., assignor to Harris Tire & Rubber Co., Philadelphia, Pa., a Corporation of Maine. Filed May 16, 1905, Serial No. 260,707. Renewed Feb. 2, 1907. Serial No. 355,472.

1. A tire including a body of fabric, a tread portion of resilient material outside of the same, and a series of fibers extending through the tread portion in a line substantially perpendicular to the wearing surface thereof and abutting upon a body of fabric, with a second body of fabric engaging said perpendicular fibers for spacing and holding them in position, substantially as described.

876,034. Steering Device for Automobiles Thatcher P. Wilson and Walter W. Wilson, Longbeach, Cal. Filed March 11, 1907. Serial No. 361,642.

1. The herein described means to steer an automobile, comprising in combination with the drag link of the automobile, a shifting bar pivotally mounted on the frame, one end of which is slidingly engaged to the drag link, and carrying on the rear end thereof a boss revolubly mounted thereon adapted to enter into a groove in the periphery of a revoluble cylinder; a revoluble cylinder keyed to a gear shaft and having an annular groove therein, the said gear shaft being workably connected with the steering wheel.

876,070. Automobile. Walter W. Macfarren, Pittsburg, Pa., assignor to William H. Donner, Pittsburg, Pa. Filed July 23, 1906. Serial No. 327,328.

1. The combination with a vehicle, of steering mechanism comprising a substantially vertical sectional steering shaft, connection between each section of said shaft and a pair of wheels to steer the same, and a clutch mechanism adapted to connect the said shaft sections so that they will rotate either in the same or opposite directions.

876,104. Steering Knuckle for Automobiles. Hinsdale Smith, Springfield, Mass. Filed Feb. 13, 1907. Serial No. 357,179.

1. In a steering knuckle, the combination with the fixed axle and a stationary upright post at the end thereof, of a rotatable sleeve bearing a stub journal inclosing said post and having an integral cap covering the top thereof, said sleeve having a lateral axle receiving opening extending upward from its bottom, whereby the sleeve may be slipped down into position from the upper end of the spindle.

876,154. Shock Deadener for Vehicles. Gaston Dumond, Paris, France. Filed July 30, 1906. Serial No. 328,465.

A double acting shock absorber for vehicles comprising a closed cylinder containing a fluid and an arch-shaped piston of such diameter as to provide a space between it and the wall of the cylinder, thereby establishing communication between that portion of the cylinder above the piston and that portion below it, said piston further provided with a port, and a spring controlled double-acting valve mounted in said port, said port further establishing communication between that portion of the cylinder above the piston and that portion below it.

876,168. Vehicle Wheel. Ira L. Goodrich, Curpertino, Cal. Filed Feb. 9, 1906. Serial No. 300,239.

1. In a wheel construction, the combination of a stationary axle, a sleeve rotatable thereon, a hollow hub having a limited radial movement relative to the sleeve, an annular air cushion between said sleeve and hub, fixed and movable annular flanges at the ends of the sleeve, said hub having annular ends opposing said flanges, said flanges each having an annular groove and a series of balls within said groove and engaging the contiguous surface of the annular end head of the hub, and annular packings between the end heads of the hub and the flanges, one of said packings being arranged outside of the series of balls and the other packing being arranged inside of the same series of balls whereby a dust-proof joint is formed.

876,210. Carburetter. John H. Miller, Bridgeport, Conn. Filed Aug. 6, 1906. Serial No. 329,373.

1. In a carburetter, the combination of an inlet for a hydrocarbon liquid, an air inlet for the purpose of bringing air into contact with said hydrocarbon liquid so as to form an explosive mivture, a movable baffle plate for partially obtsructing the flow of air through said air inlet, a lever supporting said baffle plate, a cylindrical member encircling said lever, and a lug of arcuate form mounted upon said cylindrical member and provided with a level face for controling quantitatively the degree of movement of said lever.

876,214. Vehicle Wheel. John H. Morris, Omaha, Neb. Filed June 15, 1906. Serial No. 321,864.

1. A vehicle wheel, comprising a tubular rim, a hub, a disc fixed thereto, hollow spokes fixed to the hub and disc, a pair of springs detachably fixed to the outer end of each spoke and being yieldingly attached to the hollow rim.

876,272. Means for Flexibly Connecting Parts of a Vehicle to a Frame. Edward J. Gulick, Mishawaka, Ind. Filed Feb. 21, 1907. Serial No. 358,712.

1. In combination with a frame member, and a supported member, of a socket on one of said members and a ball on the other member to constitute a ball and socket joint, a bolt extending through said members, and a spring surrounding the lower end of the shank of said bolt and secured beneath said frame member, whereby said frame and supported members are yieldingly secured together, substantially as described.

876,287. Carburetter. Morris L. Williams, Philadelphia, Pa. Filed Aug. 11, 1905. Serial No. 273,832.

1. A carburetter having a hydrocarbon passage, a valve for controlling said passage, a plurality of ducts into which said passage discharges, an air passage discharging through said ducts, and a valve for controlling said ducts and air passage.

876,351. Motor Wagon. August Hoedt, Peterawe, near Obersitzko, Germany. Filed April 5, 1907. Serial No. 366,481.

1. In a motor carriage the combination, an axle, a friction wheel on this axle, a friction disc in tangent with the said friction wheel, the axle which is connected with the said friction disc, the gearing running with the friction disc, the casing fixed to the gearing, the differential mechanism in the casing, two axles protruding from the said casing made movable and shiftable by the universal joints, and turnably arranged in the bearings, springs holding the said bearings and fastened on the axle, toothed wheels fixed at the ends of the said axles adapted to engage with the teeth of the respective wheels, the latter wheels being connected with the wheels, two hollow axles on the said axle having guiding ribs friction wheels having grooves engaging with the said ribs and adapted to be shifted by the sockets which are sliding on the bar having right and left screws, friction clutches at the utmost ends of the said hollow axles, a bar supported parallel to the axle, arms and rings on this bar, the rings of which are adapted to slide in a groove of the hollow axles which are fastened by screws on the axle and also adapted to be coupled with the said friction clutches, means enabling the coupling consisting of the springs fastened to the rings adapted to press the friction part 22 against said friction clutches, means for steering both the pair of wheels by turning the respective axles in the same, but opposite angles, substantially as shown and described.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

FRANKLIN Automobiles

No wonder heavy automobiles are losing favor. The extra weight is no longer needed.

Excessive weight belongs to the early experimental days. There is no excuse for it in a modern built automobile. It is a defect and a drawback, and unreasonably expensive.

We recently weighed nine different makes of 5-passenger water-cooled automobiles. The average weight was a third more than that of the 5-passenger Franklin Type D.

None of these machines has more strength, or more carrying ability than Type D. But their extra weight required a third more power to do the work; 37 horse-power to do what Type D does with 28 horse-power.

Type D weighs only 2200 pounds; Type C Touring-car 1600 pounds; and Type H six-cylinder, 7-passenger touring car 2600 pounds. The average six-cylinder, 7-passenger automobile weighs about 4000 pounds. Think of the difference that makes in gasoline consumed and tires worn out.

The light-weight Franklins are economical; and they are easy to handle and comfortable. You get the full benefit of them.

Before buying any automobile see it weighed on the scales, with your own eyes; and compare it with a Franklin of similar passenger capacity.

The weight question is a vital one.

Write for the catalogue describing Franklin Models.

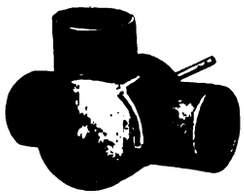
GABRIEL AUTO ACCESSORIES



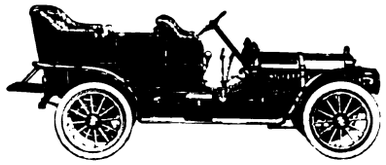
The Gabriel Exhaust Horn adds tone to the car in more ways than one. Their practical value for necessary warnings is greater than any other because of their carrying power and the tone being musical warns without startling. Can be attached to any type of steam or gasoline cars or motor boats regardless of size or number of cylinders.

The principle on which Gabriel Shock Absorbers are built is the simplest of any made. They permit a free and natural play of the springs while riding over slight inequalities and by opposing friction in exact proportion to the heavier shocks or jolts prevent the springs from going too far up or down; stopping them gradually without shock.

Gabriel Shock Absorbers were used upon the Oldsmobile "MUDLARK" recently driven by Mr. Ralph Owen from New York City to New Orleans, who says of them: "On my last year's trip I broke sixteen springs. This year while I have driven over even worse roads, I have not broken a single spring. Before starting I had the car equipped with Gabriel Shock Absorbers and haven't had any trouble at all."

The Gabriel Cut-Out by relieving the engine of back pressure caused by the muffler increases the working power available in hill climbing, speeding or on heavy roads.

If you will specify these Gabriel Auto Accessories for you 1908 Car, you will be sure to have the best.



Ask your dealer or write for booklet.

The Largest Automobile Supply House in America

The Miller Speedmeter

The Miller Speedmeter is the simplest and most compact, durable and accurate speedmeter on the market. It works on the principle of centrifugal force. The entire governor mechanism is constructed from tool steel. It is arranged for adjusting the tension of springs at all speeds, and with this special constructed governor and spring adjustment, the springs are made and adjusted to show all speeds with absolute accuracy.

Rate of Speed—We wish to call particular attention to the fact that the Miller Speedmeter will register correctly at a low rate of speed, and the hand does not bob around or fluctuate when running at slow speed.

Flexible Shaft—The flexible shaft used in this instrument is made from tool steel and each link hardened separately before assembling. The cost of this shaft is more than four times that of the wire shafts generally used.

Driving Gears—The Miller Speedmeter is fitted with crown gears with an universal attachment, which permits of the instruments being attached to any style of car on the market.

Distance Traveled—The Miller Speedmeter is fitted with an odometer, which registers the distance traveled in miles. and has total and trip dials.

Finish—The material, workmanship and finish of the Miller Speedmeter is not excelled, if equalled, by any other speed indicator on the market. Each instrument is carefully tested on a special constructed testing machine before leaving the factory, and

Is Guaranteed for One Year.—The price of the Miller Speedmeter complete, including odometer, with dial registering 60 miles per hour, $50.00.

AGENTS WANTED EVERYWHERE—We give a large discount to manufacturers, jobbers, agents and dealers in automobile supplies.

The SIX-Cylinder GREAT ARROW in Theory and Practice

Some one has said that a theoretical man, if asked to draw an elephant, would evolve one from his own inner consciousness, while a practical man would go to a zoo and look at one.

In the same way it is possible for the man of a mechanical turn of mind to demonstrate to himself that six cylinders are better than four in producing an even running, silent and flexible car, but even that is not so convincing as actually riding in a six-cylinder car. No description of the effect of riding in the six-cylinder GREAT ARROW is so complete as that it is like coasting downhill with the motor stopped and the clutch throw out. IT IS GLIDING. You feel that the car is propelled by some irresistible force outside of it rather than by the machinery that is inside of it. This is the effect of the perfect balance of a six-cylinder engine as compared with a four. The Pierce GREAT ARROW for 1908 comes as near the poetry of motion as it seems possible for machinery to come.

HERE ARE THE 1908 TOURING CARS

4-cylinder Great Arrow, 30 H. P., Price, $4,000
4-cylinder Great Arrow, 40 H. P., Price, $5,000
6-cylinder Great Arrow, 40 H. P., Price, $5,500
6-cylinder Great Arrow, 60 H. P., Price, $6,500

Get The Specifying Habit!

There is a growing disposition on the part of motorists and dealers to specify tire equipment on their cars. In other words, the man who pays the tire bills is coming to want his say as to the kind of tires he pays for. Our attention has been called to this matter particularly of late because of the large number of letters coming from dealers and owners in which the statement is made that

MORGAN & WRIGHT TIRES

have been specified on car orders. Some of these parties—most of them, in fact—have used our tires before, but not a few of them are converts to good tires thru the excellent service given to some of their friends. A New York dealer says: "Have instructed the factory to equip cars with M. & W. tires always, unless otherwise instructed." It seems to be a case of "specifying what you want when you want it." GET THE HABIT.

MORGAN & WRIGHT, DETROIT

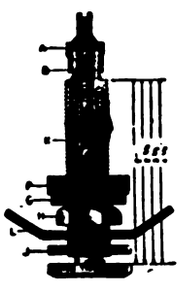
Triumph Grease, What Is It?



¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

The Perfection Grease Company, South Bend, Ind.

REO

Just Your Style

Whatever you want a motor car for—touring, speeding, climbing, or all-around everyday service—there's a REO just fitted for the work.

REO 5-passenger Touring Car

The REO Touring Car, $1,250

A big, roomy, powerful car, quiet, smooth-running, and easy-riding. Carries five people over all sorts of roads with a steady reliability that you can count on to the journey's end.

Handsome, stylish, thoroughly up to date. The winner of cups and trophies from cars of double and triple its price, in every sort of contest.

The REO Runabout, $650

A handy, speedy, spunky little car for everyday use that carries four passengers. Back seat folds down and leaves plenty of carrying space. Wonderfully reliable and economical. Carried four people 682 miles for $3.38 per passenger in the New York Motor Club's six-day economy test. Strong, able and stylish.

There are those who declare it is "too much for the money."

The REO Runabout

The new REO Roadster

The REO Roadster, $1,000

The car for speed. Actually goes 45 miles an hour. Carries two passengers, with a trunk box in the rear convertible into a seat for two more passengers.

Provided with ample carrying space. Its racy lines and beautiful finish combine to make it the "sportiest thing on wheels."

And every one of these REOS does the work of cars that cost twice the money to buy and to operate.

Write for the new REO catalogue that tells you why.

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

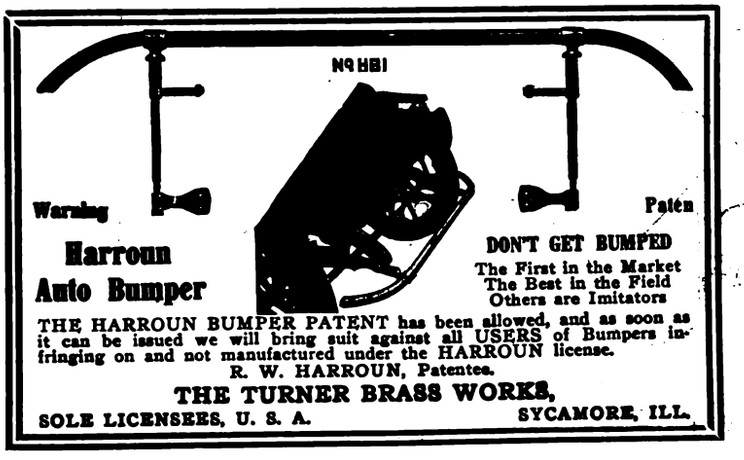
SOLAR Gas Generators

have the only perfect and scientific principle for the generation of Acetylene Gas.

Solar Generators are made from seamless drawn Brass Shells of heavy gauge.



This construction feature entirely overcomes the possibility of leakage, which is so apparent in models where seams are soldered. They are easily charged and recharged and they employ the only practical and scientific principle for the generation of acetylene gas. Even when manufacturers equip with Lamps not of our manufacture—they use SOLAR GENERATORS.

The Car You Can Afford to Buy and Keep

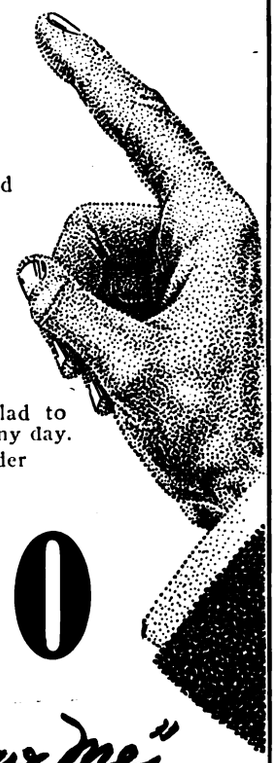
is the Mitchell.

—Because it is moderate in **price** ($1.000 to $2,000).

—Just as stylish, handsome and well finished as **any** car.

—And is perfect in each **detail** of construction.

—Doing just as well on the road and **standing up** to **wear** and **tear** just as well as the **extravagantly high-priced** cars.



Know this for **yourself,** Mr. Business Man.

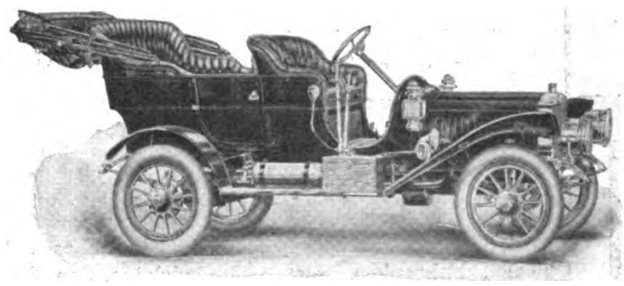
Get **demonstrations** of the high-priced cars.

Then form **your** opinion in a demonstration of the **Mitchell.**

The Mitchell agent will be glad to take you out for 50 or 100 miles any day.

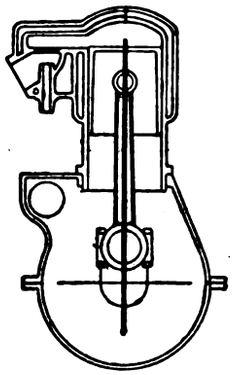
Call him up—you are placed under no obligation.

$2000



Just say "Show me"

He'll answer with the **car**—show you a **"silent** argument" that will convince you.



Write for letters proving that the Mitchell is the most economical car to **operate,** and for catalog No. 18, picturing and describing the Mitchell Touring Car $2,000, Limousine $2,800, Roadster $1,250 and Runabout $1,000.

Touring Car shown here—5 passenger, 35 h. p., 4 cylinder, speed 50 miles, finished in Mitchell blue—a very neat and extremely desirable car from radiator to tail light.

Mitchell Motor Car Co., 280 Mitchell St., Racine, Wis.

Crank Shaft on Center

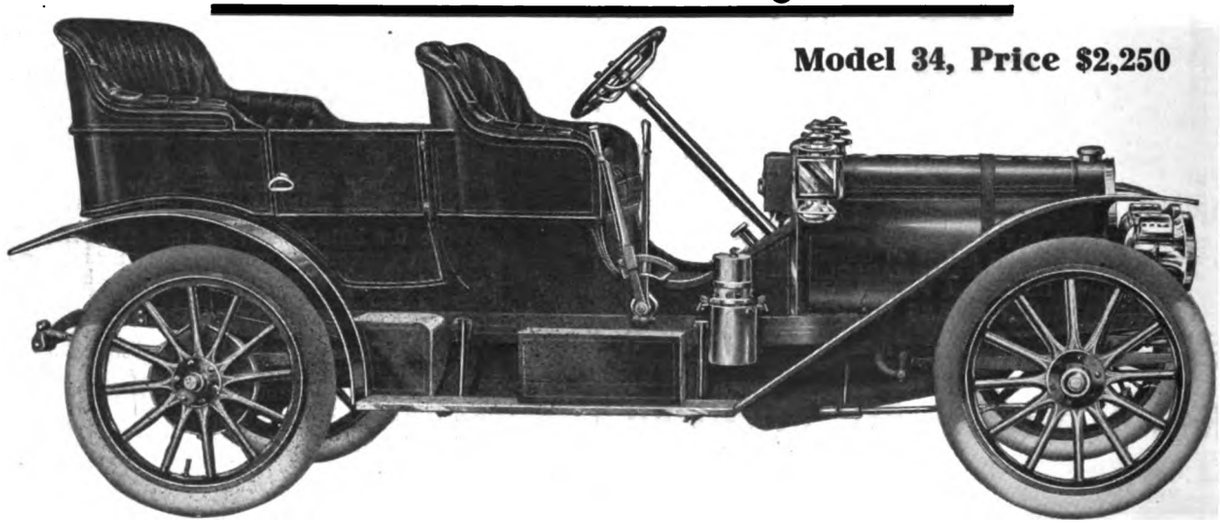
Rambler

Crank Shaft Offset

Why the Offset Crank Shaft

One of the greatest improvements in motor construction is the offset crank shaft. Its advantages are positive and direct.

First—By practically eliminating the dead center the efficiency of the motor is greatly increased through the greater leverage and more direct thrust from piston to crank shaft.



Second—Increased life of the motor through reduction of side thrust on cylinder walls and consequent saving in wear.

Third—Reduction in vibration and increased steadiness of running through more direct application of power generated in the cylinders.

Like many other fundamentally good features this must be done right and in the Rambler it is right both theoretically and practically and the result is a motor that combines the highest degree of efficieny with long life and economy of operation.

It is this and other features of equal value that make

The Car of Steady Service

Model 34, Price $2,250

This four cylinder chassis, equipped both as a 5-passenger touring car and 3-passenger roadster. Price of each style $2,250. The Rambler Utility Car with double opposed motor, $1,400.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, March 12, 1908. No. 24

DARRACQ GOES ON THE ROCKS

Creditors of the Company Make Damaging Allegations Against It—Liabilities Reported to Aggregate $100,000.

Closely following the failure of the Mercedes Import Co., another of the importing houses, the Darracq Motor Car Co., New York was petitioned into bankruptcy on Friday last, 6th inst. The petitioning creditors and the amounts of their claims are: Cole & Woop, $68 repairs; Gotham Rubber Co., $25 rubber coats, and Samuel H. Shaw, $513 commissions on sales of automobiles. They alleged that the company is insolvent, had paid out money to several creditors on antecedent indebtedness, and made transfers of property, amounting to more than $2,000.

Judge Holt, of the United States District Court, appointed Lindsay Russell receiver, with a bond of $50,000. It was stated in the application for the receiver that the company has automobiles on hand valued at $75,000, separate parts and accessories, $18,000; machinery, tools and fixtures worth several thousand dollars. It is said that business has been dull for some time past and the officers became tired of putting up any more money to carry on the business. The liabilities are reported to be $100,000.

After the receiver was appointed, the attorney for E. Lamberjack & Co., the Michelin representatives, said that several days before he obtained a judgment against the Darracq company for $2,088 for tires, and execution has since been issued to the sheriff. After the suit had been commenced the company produced a bill of sale of different cars to the New Amsterdam National Bank for $1 and other consideration.

It is said that the bill of sale was filed on January 28 and covered 12 automobiles—ten in this city, one in Chicago, and one in bond. It is also reported that the company owes the New Amsterdam National Bank $11,000. When a deputy sheriff made a levy on the office furniture at 1989 Broadway, he found six automobiles there, which it is claimed are those included in the bill of sale to the New Amsterdam National Bank.

The Darracq company was incorporated under New York laws on January 12, 1906, capital stock $100,000, which was reduced to $50,000 on April 6, 1906, to take over the automobile branch of the business of F. A. La Roche & Co., and to handle a car formerly used by the American Darracq Automobile Co. G. M. McWilliams was president, C. D. Wilder, treasurer, and Ben Wood, secretary.

Flanders Acquires Interest in Wayne.

W. E. Flanders and Thomas Walburn, respectively general factory manager and general superintendent of the Ford Motor Co., Detroit, have resigned those positions. Flanders has acquired an interest in the Wayne Automobile Co., also of DeDtroit, of which he has been made general manager, B. F. Everitt, who long had occupied that office, having been elected president. It is stated that fresh capital has been put into the Wayne company and that plans are afoot for the production of automobiles "on a scale heretofore unattempted."

Standard Welding to Make Midgley Rims.

On or about May 1st next, the Standard Welding Co., Cleveland, Ohio, will begin the manufacture of the well known Midgley rim, their ample facilities and long experience abundantly qualifying them for the work. The arrangement to that end has been made with the several constituent tire concerns of the Rubber Mfg. Co., viz.: the Hartford Rubber Works Co., Morgan & Wright and the G & J Tire Co.

Doherty Leaves Corbin for Cameron.

H. W. Doherty, formerly of the Corbin Motor Vehicle Corporation of New York, has been appointed sales manager of the Cameron Car Co. He will be located at the Beverly, Mass., factory, but will have direction of the Brockton product in addition to his duties in connection with sales.

HIGH FINANCE INVOLVES A MAKER

New York Car & Truck Co. Fails—Relation with Allen-Kingston Said Not to Affect that Company.

On Friday last, 6th inst., a petition in bankruptcy was filed here against the New York Car & Truck Co., manufacturers of railroad trucks and of the Allen-Kingston automobile at Kingston, N. Y., by these creditors: Harry J. Schnell, New York, $61,500 for loans; Carl Coonley, Port Richmond, Staten Island, $5,000 loans, and Colby N. Chester, Jr., New York, $1,768 for merchandise.

It was alleged that the company is insolvent, made preferential payments of $2,702 to twelve creditors, and admitted in writing inability to pay debts. The board of directors held a special meeting on March 4 and authorized the vice-president, Daniel G. Bogart, to admit inability to pay debts, and willingness to be adjudged bankrupt, as the company is hopelessly insolvent. Mr. Schnell holds ten notes of the company for his loans, and of these notes $22,000 are now due. Judge Holt appointed Robert Wilkinson of Poughkeepsie, receiver and authorized him to continue the business for 20 days.

It was stated that the assets were about $75,000, consisting of manufacturing plant, raw material, such as steel and iron, automobile chasses and parts, car trucks and parts, special tools and machinery and a few hundred dollars in bank. The company has eight or ten automobiles partly finished all of which, it is said, have been sold at good prices, when completed.

The company was incorporated under the New Jersey laws May 5, 1906, with capital stock $2,500,000, but had no rating at Bradstreets. It succeeded to the business of the Peckham Mfg. Co., which was put into bankruptcy on January 15, 1906. Orlando F. Thomas, one of the high financiers of the Morse-Heinze-Thomas group, whose

Digitized by Google

operations precipitated the recent panic was president of the New York Car & Truck Co.

The fact that the New York Car & Truck Co. performed the actual production of the Allen-Kingston automobiles, made it appear that the Allen-Kingston Motor Car Co., was affected or would become involved in the failure. Walter Allen, of the Allen-Kingston company, states, however, that this is not the case. He says that the latter concern paid for the labor, rent, etc, for producing their automobiles, and also advanced large sums of money to the embarrassed company, which loans are, however, secured by a bank's guarantee. Allen stated further that Orlando F. Thomas has no present connection with the Allen-Kingston company, which is contrary to the general impression that not only Orlando F., but E. Russell Thomas and others of their financial intimates were heavily interested in the concern.

E. V. Receivers' Report for February.

According to the report of the receivers, filed in court, the sales of the Electric Vehicle Co., Hartford, Conn., from February 1 to March 1, amounted to $16,880.43; and the purchases to $3,549.94. Cash on hand February 1 was $21,951.44; collected on Electric Vehicle account, $4,149.19; collected on receiver's account, $15,765.36; collected on Selden royalty, $1,335.74; total, $43,201.73. Disbursements were: Pay-roll, $6,677.89; Association Licensed Automobile Manufacturers, $806.82; traveling expenses, $196.12; insurance, $1,022.12; appraisers' salaries, $2,000; purchase creditors, $1,534.93; petty expenditures, $265.64; services of clerks, stenographers and office boys from December 1 to 10, 1907, $641.31; total, $13,144.83; cash on hand, $30,056.90.

Incorporates to Make Two Cycle Motors.

With $50,000 capital stock, the International Motor Co. has been incorporated at Detroit to manufacture a two cycle motor designed by Philip S. Claus, formerly with the Northern Automobile Co., and later with the Cadillac Motor Car Co. The company has purchased the factory at 868-890 Military avenue, with a lot 150x300 feet and railroad siding, and a factory space of 20,000 square feet. Machinery is being installed and it is stated the company expects to employe about 75 men. The officers of the company are: President, X. B. Konkel; vice-president and general manager, Philip S. Claus; treasurer, Alexander Lemke, and secretary, John Lesinski.

Diamond Branch in New Store.

The Diamond Rubber Co.'s Pittsburg branch heretofore located at 16 Wood street, has been removed to fine new store at 6122 Center street, East End., in the same city, of course. The new place was specially appointed for the Diamond company's occupancy, and contains all modern conveniences.

The Week's Incorporations.

Milwaukee Wis.—Commercial Auto Co., under Wisconsin laws, with $15,000 capital. Corporators—Oscar Eskuche, Mitchell Mackie and H. W. Eskuche.

Milwaukee, Wis.—Power Vehicle Co., under Wisconsin laws, with $25,000 capital. Corporators—George L. Stephenson, John H. Valentine and T. C. Clarke.

Detroit, Mich.—International Motor Co., under Michigan laws, with $50,000 capital; to manufacture motors. Corporators—X. B. Konkel, Philip S. Claus, Alex Lemke and John Lesinski.

Atlanta, Ga.—Motor Omnibus Co., under Georgia laws, with $40,000 capital; to operate motor stage line. Corporators—Herbert R. Brown, Macon and Judge S. S. Yodr, Washington, D. C.

Hoboken, N. J.—Mutual Taxicab Co., under New Jersey laws, with $125,000 capital; to conduct a general electric cab service. Corporators—A. V. Jones, H. M. Browne, F. W. Mills, New York City, N. Y.

New York City, N. Y.—Knickerbocker Taxicab Co., under New York laws, with $15,000 capital. Corporators—William B. Hurlburt and Sanford J. Wise, 1540 Broadway; Stuart H. Elliott, 1183 Broadway, New York City.

New York City, N. Y.—Belmont Garage, under New York laws, with $4,400 capital. Corporators—William Hirsch, 115 East Eighty-third street; Julius Wolf and Irving Wolf, 1239 Madison avenue, New York City, N. Y., directors.

Philadelphia, Pa.—American Auto-Drive Co., under Pennsylvania laws, with $10,000 capital; to manufacture automobile parts. Corporators—Walter O. Foss, George Link, Frederick C. Brunhouse, Philip C. Lang and Ralph E. Brunhouse.

Salt Lake City, Utah—Seeing Salt Lake City Cars & Automobiles, under Utah laws, with $30,000 capital; to operate automobile line. Corporators—L. C. Mariger, president; L. S. Mariger, vice-president; M. E. Christopherson, secretary-treasurer.

New York City, N. Y.—Jones Taximeter Co., under New York laws, with $10,000 capital. Corporators—Joseph W. Jones, Broadway and Seventy-sixth street; Raymond M. Owen, 1759 Broadway, New York City; Roy A. Rainey, Lakewood, N. J.

New York City, N. Y.—Metropolitan Taxicab & Auto Service Co., under New York laws, with $100,000 capital; to deal in automobiles and to manufacture all vehicles. Corporators—J. W. Cummin, L. G. Hall, and E. True, all of New York City.

In the Retail World.

W. E. Rudy has disposed of his holdings in the Majestic Automobile Co., Lima, O. Lee Beeler has succeeded Rudy.

The Orlando F. Weber Co., one of the earliest and best known of Chicago's large colony of dealers, is in the hands of a receiver.

H. B. Payne moved into his new Suburban Garage at 1624 Maple avenue, Evanston, Ill., this week. Storage, repairing and charging will be his specialty.

The Evanston Auto Co., Evanston, Ill., is located at 1024, 1026 and 1028 Davis street. A complete electric charging station is a feature of the new, commodious brick garage.

Monterey, Mexico, is to have a garage, although the exact location has not been chosen. Juan Forseck and John Austin will finance the venture. The Reo will be handled.

The Sears-Nattinger Automobile Co., Des Moines, Iowa, which occupied the premises at 812-814 Walnut street, has moved into its new garage at Tenth and Locust streets.

Fire from an unknown cause destroyed two cars in the garage of the George Abel Electric Transfer Co., Seventh avenue and Thirty-seventh street, New York City, Friday last, 6th inst. The loss is estimated at $6,200.

Robert Brunson is remodeling the old two story building at Milwaukee and River streets, Elgin, Ill., for use as an automobile garage. Following its completion he will move from his present location at 381 Spring street.

The Hayes Rubber Co. is the style of a new concern which has commenced business at 57 Warren street, New York. In addition to tires, it will handle a full line of automobile accessories. The head of the concern is F. P. Hayes, formerly secretary of the Pennsylvania Rubber Co. of New York.

Rubay Fails After Selling Boston Branch.

Peter Zucker was yesterday appointed receiver for Leon Rubay, Inc., New York, who dealt chiefly with imported accessories. The petitioning creditors alleged that the corporation was insolvent and had admitted in writing its inability to pay its debts. Its assets are placed at $4,000. Previous to the failure, the Rubay branch in Boston, had been taken over by the Percy Ford Co., a $1,000 company formed for the purpose under New York laws. Ford himself already was connected with the Rubay establishment.

No New Manager Yet for A. L. A. M.

The meeting of the executive committee of the Association of Licensed Automobile Manufacturers, held in New York yesterday, adjourned without result. No successor for General Manager Budlong's office was chosen. It was known several weeks ago that the position was tendered Col. George Pope, of the Pope Mfg. Co., but Col. Pope has no desire to remove from Hartford, and therefore respectfully declined the offer.

IMPORTANT PARTS STANDARDIZED

A. L. A. M. Adopts Uniform Sizes for Rods, Yoke Ends and Levers—Lucke Throws Light on Alcohol.

The meeting of the Mechanical Branch of the Association of Licensed Automobile Manufacturers, held in New York on Tuesday last, 10th inst., was one of the most interesting meetings of the Branch held since its organization. It being the first meeting held this year, many subjects, which special committees have been at work on, were reported and papers read. Incidentally, the annual election was held, all of the incumbent officials being unanimously chosen to succeed themselves, as follows: Chairman, A. L. Riker, Locomobile; secretary, C. F. Clarkson; metallurgist, Henry Souther; chairman test committee, H. E. Coffin, Thomas-Detroit.

A special committee appointed to work with the test committee toward the standardization of rod and yoke ends, made an elaborate report on what it considered the proper sizes for the standardization of these important parts of construction. Standards of 5/8, 5-16, 1/2 and 7-16 rods were adopted and will be known as the A. L. A. M. standard adjustable rod and yoke ends. Nearly every manufacturer of American automobiles, is, at the present time, using various sizes of rods and yoke ends and it was found that owing to the various sizes used, that there was considerable confusion in getting the proper sizes for immediate delivery. With the adoption of this standard, the manufacturers of rods and yoke ends will carry in stock a full line of the standards adopted so that users of the sizes which have been adopted may be able to buy in the open market such sizes necessary. This is of particular benefit to the user as the parts will be interchangeable, and the rods of one car will serve equally as well for another.

Another important standardization was that of levers. Various weights and sizes of levers have been used with a considerable expense, to those automobile manufacturers who do not have drop forging plants. Owing to their inability to buy stock levers, they must necessarily buy the dies from which these forgings were made and with the changing of the type or weight of the lever, new dies, at an increased expense, are necessary. After careful consideration the Branch adopted a uniform modified I beam lever, which the drop forge makers will carry in stock, making these levers interchangeable.

The committee appointed to report on the standardization of rims felt that the time was not ripe for a universal adoption of the standard rim, owing to the fact that it was impossible to tell whether the clincher or demountable rim would be in vogue. The use of spare wheels instead of demountable rims was given consideration and the Rim committee empowered to make further investigation on this matter:

At the afternoon session, Dr. Charles Edward Lucke of Columbia University, who has been making some very exhaustive tests with alcohol, as a fuel for internal combustion engines, delivered an address to the Branch. Dr. Lucke's remarks were principally in making comparisons in the tests he had made with the use of alcohol for gas engines for locomotion as compared to those for stationary use. He pointed out clearly to the Branch that with certain types of engines he could start with alcohol as easily as gasolene, by the use of a spray carburetter with the ordinary needle valve. He said that he did not feel that the time was opportune for a universal adoption of alcohol for practical use, especially in automobile engines, owing to the absolute necessity for a minute adjustment of carburetter and ignition which could not be had in automobiles, owing to the inexperience of many drivers and owners. The vagaries of alcohol as a fuel was clearly pointed out by Dr. Lucke, who explained that during his experiments conditions arose and developed to an amusing standpoint. One incident noted was that in his tests on a two-cylinder motor with crank case compression, he found that the excess vapor which had not exploded with the first charge on the in-take, escaped through the crank shaft and could be ignited. In many instances the vapor could be ignited at the exhaust. In nearly all his tests, however, a good consumption had been attained and the standard of thermal efficiency of the motor maintained.

E. R. Hewitt who has been experimenting with alcohol for commercial purposes gave some interesting data on the results of his work. Mr. Hewitt adapted an engine to the use of alcohol for a five ton truck. On gasolene with a full load, 4½ miles on a gallon of gasolene could be had. On using the motor without readjustment, only over two miles per gallon of alcohol could be gotten, but on raising the compression from 75 to 120 pounds, he was able to get over five miles to the gallon of alcohol. He pointed out that it was necessary in this case to place the carburetter as near the engine as possible in order that the mixture would be sent into the cylinder not less than 72 degrees. In cold weather he was able to overcome the loss in the vaporization by surrounding the intake pipes with the water jackets which kept an even temperature for the vapor until discharged into the cylinder. It was the consensus of opinion that for commercial work, alcohol in the near future would be the most economical fuel to be used.

An interesting lecture on the use of pyrometers for indicating and recording the heat temperature in treating steels was delivered by W. H. Bristol and Charles Engelhard.

BUFFALO'S BIGGEST AND BEST SHOW

Opening Attended by Crowd of Five Thousand—More than 150 Cars Staged Under Brilliant Canopy.

With a blare of welcome sounded by approximately 200 horns of as many degrees of power and tone, the siren chorus was the opening signal of the sixth annual show of the Automobile Club of Buffalo, in Convention Hall, that city, on Monday night, 9th inst. A crowd of about 5,000 persons crowded the hall on opening night.

The show is undoubtedly more impressive than any of the five exhibitions that preceeded it. Upwards of 150 cars, representing the standard makes, were staged under a canopy of blue and white bunting studded with thousands of white and colored incandescent lights, and fringed at the sides with a gold border and stars. Of the many exhibitors there are only three car manufacturers, these naturally being the big Buffalo concerns—the George N. Pierce Co., the E. R. Thomas Motor Co., and the Babcock Electric Carriage Co. The other exhibitors are local and branch agencies.

A new experiment is being tried this year with success. It consists of dividing the hall by four aisles, six feet each in width, instead of two aisles as formerly. This relieves the congestion to a noticeable extent and doubtless will make itself very necessary to-night (Thursday), when the largest crowd of the week is expected to attend. It will be known as "Boulevard night," when $1 will be charged every person who enters the hall, the entire proceeds to be devoted to the fund that is being raised to construct the boulevard from Buffalo to Niagara Falls.

Among the exhibitors are the following: Maxwell-Briscoe-Buffalo Co., Maxwell and Mora; George N. Pierce Co., Pierce Great Arrow; E. R. Thomas Motor Co., Thomas; Walter Hayes, Locomobile; Lewis & Linn, American; F. F. Rick & Co., R-S motorcycles; Meyer Carriage Co., Firestone Motor Buggy; Jaynes Auto Supply Co.; Neal, Clarke & Neal, Indian; N. S. U. and Racycle motorcycles; J. A. Cramer, Stoddard-Dayton and Mitchell; Centaur Motor Co., Cadillac, Oldsmobile, Peerless and Rapid; Co-operative Motor Co., Stevens-Duryea, Corbin and Lozier; Babcock Electric Carriage Co., Babcock; Louis Engle, Jr., Cartercar; E. E. Denniston, bodies and tops; O. L. Gooden Motor Car Co., Winton; Poppenberg Motor Car Co., Reo, Rambler and Premier; Empire State Tire Co.; Brunn's Carriage Manufactory, Pennsylvania and Pope-Waverly; Buffalo Automobile Exchange, Franklin; Diamond Rubber Co.

The trustee of the St. Louis Motor Car Co., Peoria, Ill., has declared a creditors' dividend of 15 per cent.

An Unusual Proposition

ARE YOU AUTOMOBILE DEALERS MAKING MONEY?

If not, why not? Is it because your apparent profit is wiped out by after-sale contingencies? Is it because your business system is faulty, your methods disorderly and careless? Is it because you are located in a district where the line of cars you sell is not adapted or in demand? Is it because you are a skimmer, not doing the business seriously, as though you had no real place in business life? Is it because you consider the selling of automobiles a game rather than a business.

The fact that so large a number of retail automobile dealers are not making money, and I am happy to say that there are few Maxwell dealers among this class, is a matter of serious concern to those in the industry.

Now, you know me; you know that I must have a good deal of experience, that my plan of covering territory has been successful; that I know the business end of the automobile business; that my plans carry.

Now I have, like our friend from Boston, a remedy. Ha, ha, you say to yourself, pretty cute. He means to tell us to sell Maxwell Cars. Yes, that's part of it, but not the only part. I have deeper reasons.

To accomplish, I want first to get into communication with you, to become better acquainted. Let me send you The Co-Operator, our own automobile paper, free for three months. I will lead up to my plan in it. It will be a valuable educator, and in due course I will give you the complete details of my remedy.

Of course, The Co-Operator says a good deal about Maxwell Cars, but it has another mission to you. It will lead to a better understanding between us, so that later I can make you a lot of money.

Apropos of Maxwell dealers making money, it is because Maxwell Cars, while not yet absolutely perfect, are the nearest perfect, and because of their correct mechanical principles; unit construction; three-point suspension; natural water cooling; multiple-disc clutch; metal bodies; and all the other distinctive Maxwell features produce satisfied users, and every user becomes a salesman and a booster. Will you please cut out the blank below and send in at once? Let us begin the good work now.

Benj. Briscoe President.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

The Touring Supremacy of The White

After a brief experience with the White, the average owner has gained such confidence in its supreme reliability and its ability to traverse any sort of road, that he plans his tours without any thought as to whether the roads are good, bad or indifferent. He knows that his tires will last much longer than on any other car of similar size or power. He is independent of everything except an occasional source of gasoline supply.

As an indication of the ceaseless touring activities of White owners, it is significant that, in many remote regions of this country and of foreign lands, the people think that all automobiles are propelled by steam power. This conclusion is a natural result of their having seen no other automobiles but White Steamers.

The White Route Books, which give detailed road directions for important touring routes, will be mailed free on request.

NEW YORK, MARCH 12, 1908

Condition of the Used Car Market.

Persistent rumors to the effect that former motorists who were hard hit, have been forced to dispose of their cars, or at least to offer them for sale at "panic prices," have given rise to the impression that the second-hand automobile market is glutted, that prices are down to the verge of nothing, and that there is absolutely no chance of disposing of a really good car at anything like a rational figure. Apparently this idea is more or less a part of the froth left by the ebb tide of financial depression, and like all froth, more or less unsubstantial.

Whatever may be the condition of the second-hand business in regard to stock on hand, it is a fact that prices asked have suffered little or no shrinkage since last fall, and that in so far as it is possible to co-relate prices and values in used machines, it is about as difficult to obtain a second-hand "bargain" as ever it was. While there may be, and doubtless are, many cars, the owners of which would like to dispose of them at substantial rates, and while shrewd buyers are making the most of the situation to drive sharp bargains, there is none of the raffling off at nominal sums, which might be supposed, judging by newspaper reports. The generally expected rise in price indicative of the coming, spring has not yet materialized, but there is no indication of an existing or probable slaughter, to cut into retail sales, or in any way diminish the value of automobiles as merchantable wares.

How Reputations are Hurt.

When a manufacturer has built up a reputation, naturally he is proud of it. Thereafter, if he is of the right sort, his greatest jealousy is to maintain it. Usually, the maintenance is more difficult than the acquirement of the reputation. For it is an axiom that success breeds imitation and though imitation may be the sincerest flattery, rarely is it relished and rarely does it serve the purpose of maintaining the proud repute of any article. Usually the chief virtue of the imitation is its price. It sells for less than the original and genuine article and because of the fact, it appeals to a very numerous class.

How greatly such manufacturing malpractice has served to injure the legitimate automobile interests is almost beyond speculation. These interests are so manifold and the satisfaction of automobile users rests in so many small things, that the wonder is that the imitators of well known accessories or of parts thereof have not worked more injury than has proven the case.

When a car or some part of its equipment requires repair or replacement is the time when the groundwork for such injury, which is another term for dissatisfaction, is laid, often unthinkingly laid. Too often the owner is intent on counting the cost; as often, the dealer or repairman is as intent on earning the handsomest possible profit. As a result, for the particular part of the equipment requiring replacement, and which always had served well, there is substituted something of slightly lessened cost. If trouble ensues, it is not always the case that the blame is placed where it rightly belongs. The entire structure may be damned and the reputation of its maker or of the maker of the particular apparatus which is charged with fault may suffer.

How true is this assertion, is well instanced by the case of a well known manufacturer of ignition apparatus. For months he had been receiving complaints of the faulty service of his product. He knew that the material and workmanship had been maintained at the same high standard that was responsible for the popularity of his output, and he was at a loss to determine the reason and cause of the very general damnation which was being visited on his goods. A searching investigation was the result, which disclosed that one of the smaller, yet most vital, parts of the whole, was being replaced, when it had been worn out from actual service, by a cheap substitute, improperly constructed, that was manufactured by a comparatively unknown firm. That the intent was to defraud, was evident from the fact that the cheap substitute was made to resemble the original in size and design, and so closely was the genuine copied that it was not detected by the manufacturer or his experts until an analysis of its component parts revealed the substitution.

Obviously this sort of thing works injury and annoyance to the manufacturer who must bear the brunt of the condemnation, and to the user of the device who fails to obtain satisfactory results, yet the latter is the real cause of the trouble, for by his policy of "penny wise, pound foolish," he makes possible the existence of individuals who live by preying on that portion of the community who strive to get something for little or nothing.

Mica Spark Plugs and Porcelain.

With the same determination to maintain their contention, that always is found when the advocates of an air cooled engine hear that type condemned by the water cooled votaries, the users of porcelain spark plugs are ever ready to assail the mica plug, and the enthusiasts of the latter type are equally willing to pick up the gauntlet; if indeed, they had not already thrown it down.

On the plug question, the users of the internal combustion engine have taken very determined stands. The contention is frequently advocated by those who use only the porcelain insulated plug that this type is far superior because of the facility with which the core may be made absolutely leak proof; and strangely enough the men who swear by the mica plug advocate the same argument in support of their claim that mica plugs give more satisfactory results than any other.

Digitized by Google

Another point advanced in substantiation of the claims for the mica plug is that the core will not break; the retort is that if the porcelain is destroyed another can be immediately substituted in the old base, which may be used indefinitely; the substitution being possible if a spare porcelain is at hand; the "if" is important and probably has had much to do with the case. And so it goes on, each using the arguments of the other to support his claim.

Again, the theory has been advanced that in the high compression engine the intense heat generated in the cylinders will cause the porcelain insulation to crack; if this is true, then experience and a matter of economy prompts the use of mica, which is not affected by the heat. But on the other hand, the contention that the mica plug absorbs oil, which turning to carbon, short circuits the plug rendering it useless, argues that the cheaper of the two would be the porcelain, providing it has sufficient merit to justify its manufacture. But in justice to the mica type, it must be said that actual instances of this shortcoming are few and far between.

Pertinent to the discussion, however, is the fact that while porcelain plugs retain favor for automobile use, they now are rarely to be found in motorcycles; for the latter, the mica plug is well nigh universal.

However, as Sheridan says: "The quarrel is a very pretty quarrel as it stands; we should only spoil it by trying to explain it."

What right have the police to interfere with the success of garage-keeping? Why, a horde of blue coats actually swept down on a New Jersey garage and gathered in a collection of hard-working chauffeurs deeply busied in the ennobling occupation of "shooting craps," and an unfeeling judge fined the "shooters" $10 each. That sort of thing will not add to the popularity of any garage. The owner owes better protection to his hard working patrons and they should demand it!

Prepare for the millenium! A New York policeman actually has arrested a city official for violating the speed law. The policeman's name is Casey. It should be engraved in the policemen's hall of fame. It suggests that some day one of them may go so far as to arrest the grossest and most reckless of all speed violators—the delivery drivers for the newspapers, the editors of which forever are damning automobiles for the same offense.

MAKING WAR ON NON-SKID CHAINS

Officialdom in Several Cities Following New York Park Board's Lead—The Two Sides of the Question.

Official objection to the use of non-skid chains on the wheels of automobiles has cropped out in other cities than New York, where they first were excluded from the park roads and parkways.

"Let them keep the automobiles indoors when it is wet and icy," is the sentiment ascribed John Minwegen, vice-president of the board of local improvement in Chicago. Minwegen regards the use of chains on the wheels as a factor in the destruction of pavements that it is only fair to the tax payers to eliminate.

The commissioners of Fairmont Park, Philadelphia, have been receiving such reports of damage done to the park driveways by tire chains that a rule prohibiting their use is under consideration. Before adopting such a rule, however, they were willing to hear objections and on Thursday, 5th inst., they heard counsel for the Automobile Club of Philadelphia, the Automobile Club of Germantown and the Quaker City Motor Club. S. Boyer Davis spoke for the two organizations first named, G. D. Bartlett appearing for the other. Mr. Davis expressed the opinion that the reports made to the commissioners had been greatly exaggerated, and in concluding his argument he said: "It is my belief that the greatly increased traffic of all kinds in recent years has had more to do with the wearing out of the roads than have the chains. The tendency of the automobile is to roll the surface of the roads rather than to tear it up, and except when rounding a curve at high speed, or when coming to a sudden stop by the quick application of the brakes, there is no scraping motion beneath the wheels. Automobiles seldom stop in the park and the curves are usually taken at reduced speed, and therefore, in justice to both automobilists and the public, I, on behalf of the two motor clubs, would ask the committee to consider fully the dangers to be encountered from driving a motor car on a slippery street without some provision against skidding before a final decision in the matter is reached." Mr. Bartlett's argument was along similar lines and the commissioners appeared to be favorably impressed by what was said.

The chain question was discussed at the monthly meeting of the park board of Baltimore early in March and John S. Gittings, who declared in favor of excluding tire chains from the parks, did so on the ground that "the automobilists who use chains in driving through the parks are causing immense damage to the roads." He backed up his position by referring to the action of the park authorities in New York. General A. E. Booth defended the use of chains in bad weather on the ground of safety, but at the same time he suggested an extra tax on automobilists to pay for repairing the roads.

COMING EVENTS

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

March 15-April 1, Omaha, Neb.—Omaha Automobile Dealers' Association's annual show in the Auditorium.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

March 18-24, New Haven, Conn.—New Haven Automobile Dealers' Association's show in Music Hall.

March 18-25, Rochester, N. Y.—Rochester Automobile Club's show in new Convention hall.

March 23-28, Indianapolis, Ind.—Indianapolis Automobile Dealers' Association's show week.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

April 6, 7 and 8, Denver, Col.—Annual show in Mammoth skating rink.

April 6-11, New York City—New York Automobile Trade Association's carnival week.

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

May 5-6, Harrisburg, Pa.—Motor Club of Harrisburg's second annual endurance run.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

Norristown to Hold Endurance Run.

The Norristown (Pa.) Automobile Club will hold its first endurance run on Tuesday, April 28th. The course will be from Norristown to Reading and thence to Lancaster and return. The rules are similar to those used in other endurance runs and provide for controls, involuntary stops of the motor, and for repairs to mechanism.

Kalamazoo Motorists Get Together.

Kalamazoo, Mich., now has an automobile club, organization of the Kalamazoo Automobile Club having been effected last week when 40 charter members elected these officers: President, James C. Hatfield; vice-president, Anthony S.Hill; secretary-treasurer, Donald C. Boudeman.

BOSTON'S JAPANNED SHOW PROVES OF REAL IMPORTANCE

Decorations Distinctive and the Early National Shows Give Big Makers Time to Produce New Models—Surprising Number of New Cars in Evidence and a Wealth of Novel Accessories, Not to Mention the Candy and the Lemonade.

Japan is quite a few miles from the United States, and its connection with automobiles is exceedingly remote, but as applied by the Bostonese, a Japanese setting for an automobile show in the United States is not half-bad.

The fact was made evident when the Boston show in Mechanics building was opened on Saturday evening last, 7th inst. The Japanese archway—firecracker red in color—at the entrance, was not put into place until Monday, but within the Oriental trappings all had been hung. White and firecracker red constitute the color scheme. The first glimpse of it is had from beneath a long bower of purplish wisteria, which, hung here and there with Japanese lanterns, is in itself a pleasing picture. On either side of the bower, exhibits are located with backgrounds of red and white. Walls and posts are hidden by bunting of those hues, relieved occasionally by the flaming red sun of Japan or some other fanciful Oriental design. "Wisteria Walk" is situated in what is termed Exhibition Hall, in other parts of which there are other and smaller bowers, but hung not with the purple flower, but with wisteria in whites, pinks, and yellows. All walks, however, lead to Grand Hall, wherein the "air" of old Japan is strongest and wherein the fountain—aye! and such a fountain—plays as also does the women's orchestra—the leader garbed in crimson, the players arrayed in white.

In the heart of Yankeedom, where thrift and ingenuity go hand in hand, it is not strange that Manager Campbell and his Bostonese aides have on the occasion of this show, as on previous occasions, demonstrated that while other promoters have spent many thousands for the same purpose, they have been able to obtain original and distinctive effects at much less than half the usual cost. For while it is plain that the Japanese setting was not unduly expensive, there is no denying that it is not only original and distinctive, but effective.

MECHANICS BUILDING, WHERE THE BOSTON SHOW IS IN PROGRESS

Grand Hall is a semi-riot of white and fiery red, but withal it is not disturbing riotness. The ceiling is hidden by narrow drapings of white and red bunting, pinned in a common center by a huge gilded crysanthemum, or what is supposed to represent a chrysanthemum. Red festooned on white adorns the balconies, and over each exhibit is a Japanese arch of the same red, within which the sign, in white, is suspended. Each space, carpeted in sage green, is hedged from its neighbor by boxed shrubbery of a deeper green, while in the very center of the hall, a giant palm uprears itself. From the greenery at its base, the fountain—yes, it must be a fountain—plays—plays eight or ten thread-like streams suggestive of boys' squirt guns, or a needle bath.

The background of the stage is a painting representing a Japanese landscape, with the snow capped sacred mountain in perspective. At the sides of the stage is a bare suggestion of pagodas, and a touch of wisteria. The arches of the stage hold two gigantic painted dragons, each of which apparently is pursuing a Japanese lady angel, who in turn seems to be fleeing for escape to a fiery Japanese sun.

Above the gallery opposite the stage and on which the women's orchestra makes music, George Washington, done in oil—one of the stock properties of Mechanics building—peacefully looks down on the scene from his gilded frame. Several American flags also serve to recall that Boston still is in

Digitized by Google

the United States. There is white and firecracker red adorning the spaces on the galleries, and some more of it hiding the pillars in the basement. It is a pleasing combination throughout and one that promotes a cheerful glow.

It goes without saying that there was a "bumper house" on opening night. For if there is anything that the average Bostonese loves better than beans and brown bread, it is that magical piece of cardboard termed a pass. The promoters of the show evidently are aware of the fact and they tickle the popular liking by distributing first night passes with a lavish hand. As a result, the building always is jammed in less than half an hour after its doors are thrown open. Last Saturday night was no exception to the rule. Breathing space was almost at a premium and the character of the crowd suggested that more than the usual number of "complimentaries" had fallen into the hands of young men and young women who measure ribbon and dispense bargains in lingerie, the while tapping pencils on counters and crying "Cash!" The small boys who respond to the cry also were unduly numerous. They helped great to swell the recipts of the candy stands and of the purveyors of root beer and orangeade—which "exhibits" long have been a feature of Boston shows.

The Boston public enjoys its show. The proportion of probable buyers may be small but it does not prevent the young and the old from taking real interest in the cars and the accessories and in gathering in force and looking curiously into the bowels of a car and listening intently to any salesman who may undertake to satisfy anyone's desire to learn what's what. They are great collectors of catalogs and souvenirs, too; and they love to sit long and listen to the music of the band. Even when the automatic piano unlimbers and the attendants who are intent on selling sheet music lift up their voices to prove the quality of their wares, they receive their full need of admiring attention.

Boston enterprise also contributed something of a surprise to all of the exhibitors. Early Monday morning each of them received in a plain envelope addressed in feminine handwriting and marked "Personal." When it was opened, a card, typographically in good taste, was disclosed informing the recipient that Miss —— was prepared to perform expert manicuring at her establishment either morning or evening or at her patrons' home, when it was so desired. It was observable that not all of those who received the cards threw them away.

Manager Campbell also had some of the trade visitors guessing for a while. Their admission buttons are in the form of a small silver fish designed to be worn in the coat lapel. What connection there is between fish and motor cars was a source of much speculation, which found vent in suggestions that a "fishing excursion" was on, that some one would "get the hook" and so forth and so on. It required a native Bostonese to set the unthinking strangers right: Boston is the home of the sacred codfish; hence the button.

But despite the candy and lemonade stands and the automatic piano and other catchpenny devices, which subtract a trifle from its character as an industrial display, the Boston show is a fine, large, impressive show.

Practically all the well known makers are represented. Such names as White, Winton, Northern, Great Arrow, Royal and Corbin, are prominently displayed in Grand hall, as are those of Stoddard-Dayton, Apperson and Berliet, Stevens-Duryea and Stearns. Mitchell, Pope and Elmore are hardly less prominent. In exhibition hall, and side by side, are the Marmon and Franklin exhibits, with Rambler, Cadillac, Packard, Locomobile, Thomas and Matheson cars, close at hand. There, too, are the National, Reo, and Rainier displays, none the less prominent through being catalogued under agent's names, while Oakland and Brush, go well in the same vicinity, flanked by Studebaker and Premier cars, with the extensive Maxwell line displayed to advantage down by the outer entrance. Among the basement exhibits are to be found the Frayer-Miller trucks, as well as a White car, equipped with a special ambulance body, the Knox, Waltham and Studebaker commercial vehicles.

Rather surprising in a show coming so late, is the staging of several new models by makers well known and thoroughly exploited at former exhibitions of a like character. Prominent among these is the new Locomobile "40 Runabout," which has not been introduced publicly before, and which is a low-hung, modish affair, built on clean cut, distinctive lines which, though in many ways a departure from former Locomobile practice, yet retain sufficient stability to make it a worthy member of that respected and much prized line. Mechanically it is merely a new version of the model "I" 40, which already had been shown. That is to say, it is driven by a 5 by 6-inch, four cylinder motor, has make and break ignition, with low tension magneto, selective change gear and double chain drive, and very large braking surfaces. In distinction from the former type of runabout, it has a lighter spring suspension, owing to the use of a lighter body; the seats, besides being of entirely different contour, are lower, giving the close-to-the-ground appearance already noted; and a larger steering wheel is used, mounted on a column which is given a considerable rake in order to bring it into convenient position. The rear seat, instead of being mounted on a turtle deck, is placed upon an artillery box, and is demountable. On this account, either one or two passengers may be accomodated behind by the use of one or two bucket seats, the box may be left bare, or it may be removed entirely, leaving the flat deck for carrying purposes. Even without removing the box, however, there is ample room back of the driver's seat for stowing such luggage as a trunk, large hamper or several suit cases.

The same spirit is manifested in a new Studebaker creation, also shown for the first time, although mounted on the 30 horsepower chassis which is already well known to 1908 show goers. It is styled the

Digitized by Google

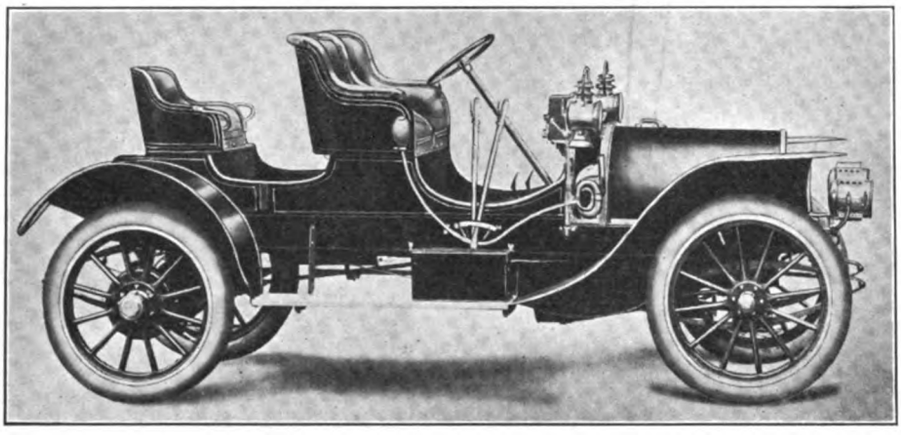
Suburban Roadster and is adaptable for the transportation of two, three or four passengers, according to circumstances, or to the accomodation of a surprising amount of luggage or camp paraphernalia in the roomy box body. The general form is that of the conventionalized Beverly Wagon, with fully enclosed box body set off with rectangular outside framework into regular panels. The rear seats, of which there

PICTURESQUE "WISTERIA WALK" IN EXHIBITION HALL

are two, are interchangeable and may be mounted on the box as desired to carry one or two passengers.

One of the features of the Franklin exhibit which cannot fail to catch the eye of the visitor is an occular demonstration of the authenticity of the catalogue specifications given out by the maker of this staunch exponent of the air cooled motor and the wood fame. One of the 1908 cars is mounted on platform scales, each wheel being supported independently of the others, the combined indications of the four scales adding up to a figure nearly 200 pounds less than the nominal weight of the car. A large dial mounted on the vehicle is equipped with two hands, one of which points to the rated weight of the car and the other to the actual weight shown by the scales, proving conclusively that the catalogue states fact with a very respectable margin of truth to spare.

The most recent of the many Franklin offerings is the light rumble runabout, especially suited for the uses of physicians who employ drivers, and occasionally wish to carry a friend or patient in addition. It is built on the model G chassis, has the same 16 horsepower, quadruple motor, equipped with the new concentric valves, and 90-inch wheel base. The rear seat, which is designed to accomodate a single passenger only, is mounted on a plain box, the sides being cut away slightly to afford easy access, while the general effect is that of the continuous body, rather than the detached seat carried on a flat deck. The lines of the vehicle are tastefully arranged, and while the effect is sufficiently light and graceful to be pleasing, it is still decidedly practical and substantial—which is an important point of distinguishment.



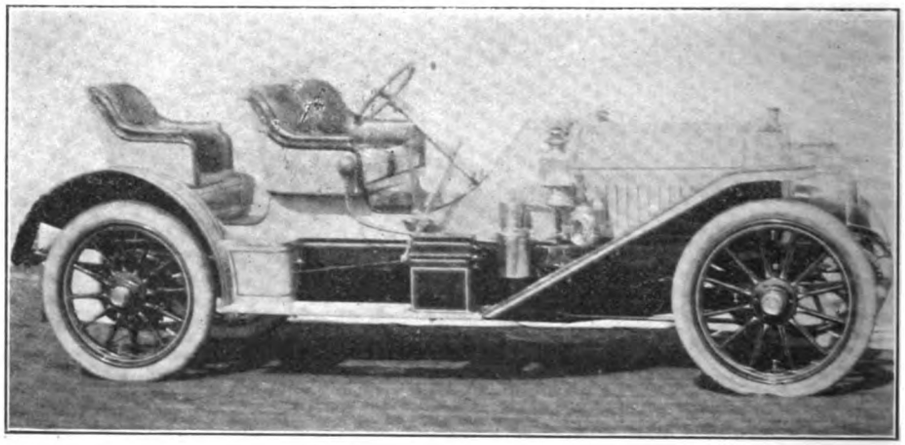
Among other favors it was reserved for Boston to have the honor of uncovering the first of the 1908 Ford cars to be seen at any show. Model S, which is made in no less than three varieties, with but small distinction between them as far as really vital points are concerned, is no less a mechanical and manufacturing achievement. In a general way it much resembles it. There are the same motor and transmission, the same features of control, and, practically the same outline, except, that, as in the case of last year's model R, the fenders are connected by a running board, while the seats are more liberally proportioned and consequently more comfortable to ride in. Model S Roadster is an improvement on the first, to the extent of a rumble seat, a concave dash, flanged mud guards, and one or two other points which make for an improvement in appearance without altering the road performance of the vehicle. A third adaptation of the same chassis design is found in a wonderfully attractive little inside-driven coupe, which at the price, $800, is calculated to form a most useful accessory to the business of the doctor, rural or suburban.

The usual aggregation of closed vehicles,

Digitized by Google

which has come to be an expected feature of all present day shows, is in this case augmented by a couple of newcomers in addition to that just mentioned. One of these is the taxicab of the new Oakland line which made such a favorable impression on its first appearance at the time of the Chicago show. Like the touring car which it accompanies, this vehicle is of particularly light and graceful mold, and substantial looking withal. The pleasing exterior of these cars is all the more noteworthy as housing one of the most original power plants ever put into a chassis.

Another gratifying interpretation of the motor cab idea is found in the new Atlas vehicle which is being shown for the first time and which is mounted on a chassis especially designed for the arduous service which is expected of the commercial passenger vehicle. The power plant is the twin cylinder, two-cycle Atlas motor, which is used in the entire line, planetary change gear and shaft transmission to the rear live axle. An unusual and novel feature of the machine, which is sufficient in itself to attract no little attention—particularly in a vehicle intended for practical service of this sort—is the motor starting device. This is a ratchet contrivance operating directly on the fly wheel of the motor and worked from the driver's seat by means of a handle which is placed in the foot board at the right end and just in front of the seat riser. Simply pulling up the handle sharply gives the crank shaft the slight twirl required to set the engine in motion.



FRANKLIN 16 HORSEPOWER RUMBLE RUNABOUT

One or two cars which are new to Boston, and which have been only in one or two other of the smaller local shows, are worthy of passing note. One of these, the Blomstrom "gyroscopic" car is remarkable in that its two cylinder opposed motor is set in the fore part of the car with its crank shaft vertical. The fly wheel, which is below the cylinders, is of very large diameter and is formed with a perfectly flat surface underneath which serves as the driving member of the double disc change gear. The driven member of this group is mounted slideably on a forward extension of the propeller shaft and is actuated for application of the driving effort by means of a foot pedal, while the speed ratio is controlled by a side lever. By depressing a button in the top of this lever the gear changing arm is released from engagement and a second rocker arm picked up which actuates a cam clutch on a special flange on the upper side of the fly wheel. The effect of moving the lever back and forth after depressing the button is that of "cranking" the motor, and in this way, starting from the seat is made ane easy effort.

The "Crown Special" is another which has only recently come into being. It is a four passenger runabout of light, racy and modern construction. It is engined with a 45-50 horsepower four cylinder motor, has a selective change gear and shaft drive. By dint of throwing the front axle well up to the radiator line and setting the rear axle back, the 114-inch wheel base is made to support the neat, low body in easy and effective fashion.

The Speedwell, which is still another of the same class, is shown in runabout and touring car types, as well as in plain chassis. It is a 40 horsepower, shapely vehicle, built on approved lines and having about it no element of untried or unproven quality. The cylinders are individually cast and measure 4¼ by 5 inches. Double ignition is provided by the use of both high tension magneto and battery and coil systems, the pump is gear driven, the radiator is cellular. Transmission is secured by means of a selectively operated, vertical gear set and propeller shaft, the entire system being mounted on Timken roller bearings. The body is hung on semi-elliptic springs in front and full elliptics in the rear, the latter being coupled to an angle bracket well above the frame in order to give plenty of spring set without raising the body too far off the ground. The wheel base is 116 inches, the wheels 34 inches in diameter shod with 4-inch tires all around, and the body is designed for three and five passengers respectively, in the runabout and touring car models.

The Brouhot car, which was one of the promised innovations of the show, failed to materialize during the early part of the week, as did the Viking—a local production which was to have made its maiden appearance. Another car which was not on hand on the opening night, but which was promised certainly for today (Thursday) is the new P & S, which is just being brought out by the Palmer & Singer Co., New York City. It is a machine mounting the "C. G. V." type of bonnet with radiator suspended below the frame and made in three general types corresponding to the uses of the touring, runabout and town and country cars. In the latter, which is equipped with landaulet body, the frame is developed into a double drop just in front of the rear wheel to allow for a low entrance and easy step without reducing the road clearance correspondingly. The power of this model is given as 28-30 and other general specifications include 112-inch wheel base, 34 by 4-inch tires, semi and full elliptic springs, front and rear, transmission by multiple disc clutch, selective gear set mounted on ball bearings, and cardan shaft. A somewhat similar mechanical equipment is applied to the "Skimabout" which is equipped as a light, two passenger vehicle for hasty road work.

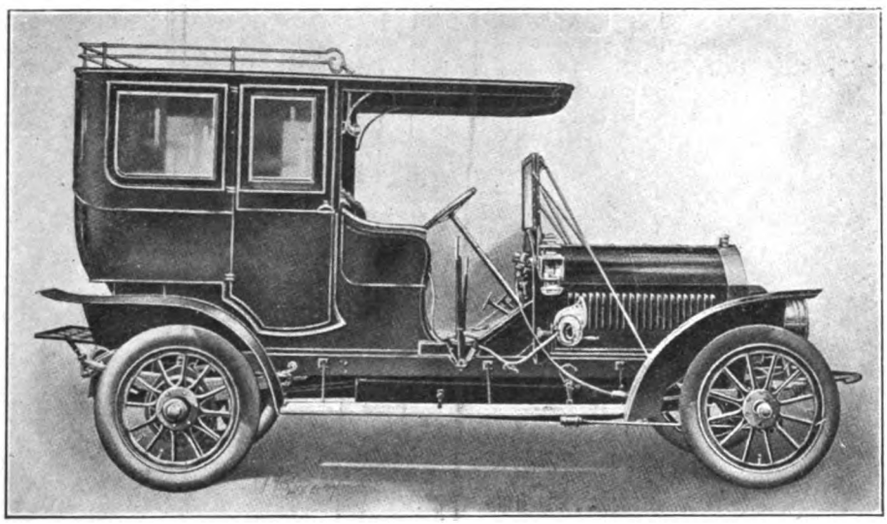
LOCOMOBILE 40 RUNABOUT

Practically all cars of wide repute have

Digitized by Google

been shown previously at the New York and Chicago shows. But, as is always the case, several New England makers reserve their efforts for this show, where, with pardonable loyalty they display their new models for the first time. In this instance there are ten makers and as many vehicles which are to be included in this category. One of these is the Shawmut, which the Shawmut Motor Co., Stockham, Mass., introduces to its second year of existence with a new motor of improved pattern and several other improvements, while yet retaining many of the features which distinguished it a year ago. The motor in question is of quadruple pattern and has twin cast cylinders of 4.8 by 5.5-inch, bore and stroke. It is distinguished among other points by an original carburetter set in close up to the cylinders with a large mixing chamber leading directly to the siamesed intake ports, practically without anything corresponding to the ordinary manifold. A further point of interest is the use of independent exhaust pipes from the cylinder groups to the muffler, thus giving a perfectly free outlet for the gases at all times. Another new feature is the original dredger oiler which, unlike many devices of the sort, has a variable rate of feed, made possible by altering the number of teeth picked up by the feeding pawl at each revolution of the driving shaft. The vehicle itself is expensively built along the lines generally characterized as "continental" and is originally designed in every particular saving that of ignition and body equipments.

A new model known as the "Forty Roadster" has been added to the Springfield line, which is the product of the H. C. Medcraft Automobile Co., Springfield, Mass., in addition to which several changes have been made in the construction of the chassis, which is practically the same with all types. The new machine is a two, three or four passenger vehicle of the popular order, mounting a nobby and rather unusual sort of body which carries out the idea of the old time box buggy to the extent of employing raised sides for both front and rear foot boards, thus excluding all draught from the lower extremities of the occupants, and incidentally, affording a touch of novelty to the general appearance of the vehicle which is most gratifying. A further novel effect is secured by the exceptionally low seat line and the high backs, which are carried out uniformally for both front and rear seats. The rear member, as is the case with several other of the new runabout models, may be used either as a one or two passenger accomodation by adapting the double removable bucket seats to suit the instant's requirement. The wheel base is 114 instead of 108 inches, as in the touring cars. Of the changes in construction which have been introduced this year, the adoption of double ignition by means of Comet magneto, unit coil and high tension distributor, in conjunction with the battery equipment, is noteworthy, as is the use of ball bearings throughout the axle equipment, in place of roller bearings. A new type of transmission also is employed, involving the use of a selective gearset having chrome nickel steel gears, and the use of a buffer torsion rod, in place of the radial side rods formerly employed.



Although the Stilson Motor Car Co., Pittsfield, Mass., has been making six-cylinder cars, and six-cylinder cars only, for some little time, this is the first occasion on which one of them has been on view at any show. The vehicle is characterized by

GENERAL VIEW IN GRAND HALL

Digitized by Google

a number of original points, chief among which are those centering about the motor. The power plant is supported on a sub-frame running well back of the center of the car, and the engine base is carried on this by means of solid webs running the entire length of the crank case on either side. An unusual feature in addition to this, is the method of lubrication, which consists of a flush-feed system actuated by gravity from a tank concealed in the concave dash, and supplied by pump return from the engine base. The leads from the supply tank are carried over to the left side of the crank case and delivered to a distributing manifold concealed in the base, and tapped off at intervals for the various bearings. The crank shaft is supported on seven bearings, which is made possible by the use of independently cast cylinders. Like the oil tank, the coils are concealed in the dash. They are employed in connection with the full system of double ignition, using two sets of plugs, and the Bosch magneto. The car itself, outside the engine, is designed in the conventional way. It has 123-inch wheel base, 34 or 36-inch wheels at the option of the purchaser, 4 and 4½-inch tires, front and rear, and weighs 3,400 pounds. The motor, which is 4 11-16 by 5½ inches, bore and stroke, is rated at 50-60 horsepower.

STILSON SIX-CYLINDER CAR

The reorganized Grout Automobile Co., Orange, Mass., brings to the show, in addition to its touring car, a brand new "tourabout," which is to say, a four-passenger car of approved pattern, mounting a number of the Grout features, such as double ball bearings, original in design and closely resembling the so-called bicycle type for each of the wheels, and the use of a wood frame armored, and supporting the motor and transmission by means of a metal sub-frame. The change gear system is selective in operation, but has a direct acting lever, the selection being made by means of a finger action which picks up one or the other of two rocker arms, actuating the sliding members. The motor is rated at 35 horsepower, and the wheel base is 115 inches. The new body carries two double bucket seats of practically identical pattern, is substantial in appearance, and serviceable looking as well.

Bay State Forty, is a name which first came to light a year ago when the Bay State Automobile Co., Boston, offered its initial product at the show. The product remains at this time, practically unchanged, so far as both minor and major details are concerned. Among the features of the machine which are particularly well worth remembering, are the use of "triple" ignition, by means of a high tension distributor and unit coil—used either with magneto or battery—as well as the usual battery and coil system, with two sets of plugs; the use of a "cushion box," or shock absorber in the transmission line, between the clutch and change gear; the method by which the sub-frame carrying the power plant is supported on three points, with the third in the rear; and the use of double trussed torsion rods on the rear axle. The motor supplies 40 horsepower on requirement, the change gear affords three forward changes of speed, the wheel base is 122 inches, and the weight inclusive of equipment is 2,900 pounds.

Coincident with the opening of the present show, Boston became the birthplace of two new motor buggies, both of local origin, and both designed on somewhat original lines. Because of their extreme youth, it is not surprising that neither of these newcomers should have been on hand for the opening of the exhibition. In the Boston Highwheel automobile, the Boston Highwheel Auto Mfg. Co., Boston, is producing not simply a new member of a rapidly growing class, but also a vehicle embodying a number of radical features. The motor, which is of the double-opposed, air-cooled type, is mounted within the body and directly over the rear axle. Transmission is accomplished by means of a single belt operating over a pair of expanding pulleys adapted to give a wide range of speed variation by the simple movement of one lever, and without the necessity of declutching when changing speed. For purposes of reversal, a double bevel gear connection is established between motor and transmission, only one being in use at a time, one affording the forward and the other the backward drive. A trapezoidal belt is employed, 1½ inches wide, by ¾ inch deep. Another novel feature, is the adoption of a differential brake, acting upon the balance gear in the counter shaft, which drives the rear wheels through side chains. By depressing a foot button at any time, the action of the differential is checked, whereby skidding, or excessive differentiation due to unequal adhesion in mud or snow, may be checked. The wheels are 44 and 48 inches in diameter, front and rear, respectively, and are mounted on roller bearings of original design. The wheels are heavily dished, and are shod with 1⅜-inch solid tires. The weight complete is about 900 pounds.

Although designed and marketed in Boston, the Crown Motor Carriage, which is just being introduced to Boston by the Crown Motor Vehicle Co., is made largely in Amesbury, Mass., whence come so many New England carriages. It has a double opposed, 12 horsepower motor, air cooled, and hung on three points. Transmission is by means of an original adaptation of the multiple disc clutch idea, two clutches being employed, and affording two speeds forward and two in the reverse direction. The wheels are 40 inches in diameter, shod with 1⅛-inch solid tires. The wheel base is 74 inches. A special feature is made of the body, which is of unusually roomy design and has a seat 21 inches deep, and 43 inches long.

The Bailey electric phaeton, manufactured by S. R. Bailey & Co., Amesbury, Mass., will be remembered as the vehicle distinguished by its originality of construction—an originality which commences with the wheels, and continues through every fiber of the structure. As shown for the first time last year, it embodied in the frame, body, and running gear, a number of unique features. Most of these have been continued over into the 1908 model, while one or two new ones have been added to them. Among these may be mentioned the steering device. This is in principle and action, the same as the ordinary tiller arrangement. Upon the upper extremity of what is apparently an ordinary steering column, is mounted a wheel, complete except for the side next the driver, which is bounded by a short chord, leaving the outline roughly D-shaped. The entire column takes the part of the tiller and is swung from side to side in driving the car, its motion being guided by an inverted segment mounted on the dash. An ingenious switching device, prevents the running plug from being inserted until the controller—which is mounted above the steering "wheel"—is set in neutral position, while correspond-

Digitized by Google

ing arrangements provide for the interrupting of the motor circuit whenever the foot brake is applied.

Of all steam cars, none perhaps, has a stronger hold over Boston than the Newton product, the Stanley, which this year appears in somewhat modified form as to power plant, and with several variations in body mounting as well. Of the former, may be mentioned the use of a new water indicator, and a new pump transmission which is a simplification and improvement over the former arrangement, as well as the new double by-pass on the water line, which is connected and controlled through the steering column. Of the new models, Model K, is a gentlemen's roadster, having practically the same power plant as was the moving feature of the one-time famous "Florida Bug," while Model M, is a seven passenger touring car—the first of its kind to be made by the Stanley Motor Carriage Co.

Another newcomer in the quartet of steam representatives present, is the Clark, made by Edward S. Clark, and a thoroughly Boston product. The latest model, which is on view at the show, is equipped with a new engine, which, unlike that employed last year is of the single, four-cylinder opposed pattern, having single acting pistons and poppet valves. The transmission gearing also has been improved to the extent of embodying high, low and neutral gears. Reversing and cutting off are accomplished by manipulating the cam shafts. The vehicle on exhibition is a special model, built on the standard chassis, but differing from the regular model in several points, such as the use of the aluminum dash, special body and trimmings. The motor is rated at 20 horsepower, the wheel base is 110 inches, the tires are 36 by 4 inches, and the total weight is 2,800 pounds.

Boston is no exception to the accessory rule of all shows, but rather the superlative degree of comparison. The present show possesses by way of attraction nearly everything which has charmed or disgusted the accessory chaser at other shows and several things more, some of which are well able to stand alone.

The rotary motor, for instance, is obliged to stand alone, because it has no rival. As exhibited by the American Rotary Moto Co., Boston, it proves to be a rotary motor and not a motor which rotates, in that it contains but one essential moving part which is a piston of approximately oval section revolving in a casing which is opened at either end to receive a pair of abutments which bear against the piston to form a closed explosion chamber between it and the walls of the casing, or open, to release the spent gas to the exhaust pipe. Since there are two such abutments and consequently two explosion chambers, the mixture, which is admitted under pressure, is fired simultaneously and produces two co-incident impulses every revolution. These motors are not quite ready for the market, but shares in the company's stock are announced in a circular as being for sale at a popular price.

Then there is the change gear system which, though of the ordinary sliding pinion type, is so devised as to prevent all possibility of stripping the gears when meshing them. To this end, the driven gears are mounted loosely on a screw thread instead of being keyed to their shaft as is ordinarily the case. When the primary engagement takes place and the ends of the

CENTRAL VIEW IN GRAND HALL

teeth are meshed, the driver commences to turn the driven gear, as is the case in the common arrangement. As the only resistance encountered is that of the screw thread mentioned, and a light spring which tends to hold the gear away from its position of normal engagement, however, there is no chance of stripping the teeth. By the time the teeth have engaged to their full width of face, the driven member has advanced far enough along its screw thread to pick up a double dog clutch on the shaft, which it then begins to drive. Conversely, when the gears are drawn out of engagement the spring referred to develops sufficient tension to run the driven gear back along its thread and free it of the driving dogs. The device is being shown by its inventor, H. O. Fletcher, Hyde Park, Mass.

Having got this far in the "improvement" of the automobile, it is natural to look next to the tires. There the investigator at once falls into a perplexing dilemma. If he prefers the "legitimate" in the sense of the conservative and popular patterns already in current use, he may visit the booths where such well known brands as the Hartford, Goodyear, G & J, Diamond or Firestone tires are on view. But if he prefers the more novel devices, he must investigate the original principles of the Dow and the new Shaw Self-Sealing tires, both of which are alike in comprising an inner tube having an envelope wall on the tread side into which some special compound is inserted for the everlasting damnation of all the little puncture fiends.

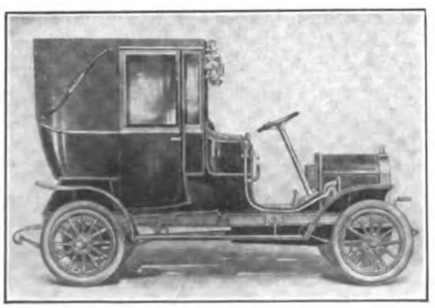
In the Shaw tire, which the Automobile Utilities Co., Boston, is showing for the first time, the filling in question comprises a layer of melted rubber and asbestos fiber which it is claimed will amalgamate perfectly with the tread rubber when blown into a wound in the tire, forming a perfect cure for the ill. There is also the Zeglen Bullet Proof tire, which besides being immune from damage by the wayside sheriff is claimed to be unusually resistent in the matter of ordinary punctures, if not absolutely hole-proof in every way. The Zeglan Bullet Proof Cloth Co., Chicago, Ill., also make a specialty of bullet proof vests and material. The Ball Bearing Tire Co., Providence, R. I., presents a modern version of a somewhat old idea in the ball bearing tire, in which the shoe encloses a rubber filler containing a series of spherical, molded pockets which contain as many balls of pure gum rubber, vulcanized and moderately inflated, while on the rim side is an open chamber capable of inflation to the required degree. If one ball is punctured, the tire is not deflated—and there you are, simple as can be! The Commonwealth Rubber Co., Reading, Mass., exhibit the Mitchell Puncture-Proof tire, which is practically a tire within a tire—but not in the ordinary sense. The outer tire is of the solid variety, while the inner and pneumatic one is of smaller great diameter and serves as a support for the rim which carries the tread shoe.

While omitting the previously exhibited wares of such makers as produce the "Connecticut," "Heinze," "Witherbee," and "Pittsfield," and skipping the several well known makers of batteries, and commutators and attachments and fixings and supplies, there is yet considerable to see that is new in the ignition line. As, for instance, the Two-Spot spark plug shown by the Two-Spot Mfg. Co., Canasota, N. Y., which comprises a central insulated electrode and an extended and hooked ground wire, between which is interposed a little spool of porcelain surrounded by a single coil of fine wire. The spark jumps first, from the insulated pole to one side of the spool, and then from the spool to the ground wire, making two jumps across two gaps. As the spool is mounted in such a way as to turn constantly under the influence of the action going on in the cylinder, there is supposed to be no chance for sooting to occur. Another novelty in the plug line is to be seen in the Sterling, in which the Windsor Mfg. Co., Worcester, Mass., presents a device, ordinary, except that the insulated central wire is bent twice, first at

Digitized by Google

right angles and toward the shell, and then circularly and parallel to the beveled edge of that member. The spark has opportunity to jump in several points at once—if it wants to. And apparently it does. The Sterling Mfg. Co., also are showing a new automobile vise, it should be observed parenthetically, which is excellent in several ways, but principally because it is small and can be clamped to the running board without necessitating the use of any permanent fixture likely to interfere with the normal use of the step. The device is swiveled on its base and swiveled in its main clamp so that it has a universal motion, contains pipe jaws under the main faces of the jaws, and wire holding jaws as well. Furthermore it is hardened and oxidized, so that it is durable beyond the average measure of such contrivances. Speaking of ignition systems, however, the Orswell method of firing the charge in the motor cylinder, consists in the use of a single master vibrator enclosed in a neat case of vest pocket size, and the igniter, which is a combined coil and plug, having no external secondary connection, and which screws directly into the cylinder it is intended to fire. The system of the Sterling Alternating Ignition Co., Binghamton, N. Y., is such that every time the primary circuit is closed through the single master vibrator, the current flows oppositely to its direction during the previous and succeeding ignition periods. This corrects the pitting action of the current on the contact points of the vibrator.

If you want to know how the Standard Speedometer works, you can readily tell by observing the Brobdinagian working model on view at the stand of the Parker Mfg. Co., Roxbury, Mass., where an exaggerated reproduction of the device informs you it is the principle of the fly-ball governor all over again. Or, in the case of the Casgrain Speedometer, you are permitted to dissect one of the devices all by yourself and examine the parts, in order to learn that it is fluid friction, brought about by the agitation of the oil-contents of the device, which is set in motion by a little paddle wheel, which drives a second and enclosing paddle wheel sufficiently to rotate the indicating drum and reveal the number indicating the speed of the vehicle. You discover, by the way, in case you did not know it already, that speedometers have formed an interesting subject for study to a good many men in times past. Their conclusions are exhibited in concrete form at the booths of the Jones Speedometer Co., Hoffecker Co., R. H. Smith Mfg. Co., Warner Instrument Co., Wm. H. Jones, and others, not to mention that of Chas. E. Miller, where you find a little of most everything else as well.



The same is true in kind, of the displays of shock absorbers. The Hartford Suspension, the Foster, Kilgore, Hotchkin, Gabriel and others, may be familiar in action. But the Flentje shock absorber is a new device, of the fluid type, working like a pump with a multi-ported valve on its upper face, to check the rebound. The Du-Ro, which is the invention of Duncan Robinson, Boston, involves a novel application of the principle of the ordinary leaf spring, obtaining its action through the combined effects of elasticity in the blades, and friction between the leaves. A multiplicity of very thin, flat spring leaves, are packed away together in a circular case which is so shaped that the movement of the working part causes the leaves to be bent up with increasing movement and resistance progressively. Another new thing in the shock abosrbing line, is the offering of the Ciglia Shock Preventer Co., New York City, which looks very much like something which it is not. The necessary resistance to motion in the arm, is obtained by means of a couple of interlocking discs, having irregular faces, held together by means of a five-pronged star-shaped, spring washer. When the arm moves, the tendency is to separate the discs against the pressure of the washer.

Safety devices, in general, multiply without end. But the Barber Safety, which is the indefinite name applied by the Motor Safety Mfg. Co., Brooklyn, N. Y., to its novel device, is worthy of more than passing note. It is a scheme devised to preserve the bones of him who would fain start the "kicking" motor without retarding the spark. By means of a ratchet detent mechanism which is inactive so long as the resistance of the motor crank shaft is normal, the ordinary starting ratchet is disengaged just so soon as the resistance in the motor exceeds a predetermined amount—which it is sure to do in the event of a backfire. The bone saver is enclosed in a small metallic casing of inconsequential aspect, and is attachable to any starting crank without requiring material alterations in the arrangement.

Excepting the candy, lemonade, music and newspapers, the exhibits are as follows:

Automobiles.

The White Co.—White.
J. W. Maguire Co.—Great Arrow.
Thos. B. Jeffery & Co.—Rambler.
Stanley Motor Carriage Co.—Stanley.
Curtis-Hawkins Co.—Chadwick, Speedwell.
Geo. J. Dunham—Royal Tourist, Corbin.
Winton Motor Carriage Co.—Winton.
Reed-Underhill Co.—Knox.

Smith Gave San Jose a Show.

Although San Jose, Cal., has not a sufficient number of automobile dealers to make a large show possible, it possesses one dealer who is alive to his opportunities—Harrison P. Smith, Inc., agent for the Stoddard-Dayton, Pope-Hartford, Reo, Kisselkar and Baker. Smith held a show of his own on Thursday, Friday and Saturday, February 27, 28 and 29, and had factory representatives on hand to explain the features of the five cars on display. The garage was tastefully decorated, and several local concerns took the opportunity to serve free refreshments and dispense music. More than 5,000 persons were entertained during the three days the show was in progress and Smith booked several sales as a result. Other dealers expressed satisfaction over its effect in stimulating interest, while Mr. Smith is so well satisfied that he purposes an annual repetition.

Lincoln's Show Drew a Crowd.

Lincoln's first automobile show attracted a large crowd of Nebraskans to the Auditorium in that city last week. The show opened on Monday and continued until Saturday last, 29th inst. Nearly all the local dealers were represented, the cars on display being the Winton, Buick, Northern, Oldsmobile, Aurora, Maxwell, Jackson, Lambert, Glide, Rambler, Mitchell, Holsman, Baker, International and Fuller. The last named is made by the Angus Co., of Angus, Neb. The first car, made eight years ago, holds the distinction of being the first "made in Nebraska."

THE RUMPUS THE WOMEN RAISED

It Upheaves the San Francisco Dealers' Association—But Their Show Succeeded, and Wu Praised Them.

"Where is the man who has the power and skill
To stem the torrent of a woman's will?
For if she will, she will, you may depend on't;
And if she won't, she won't; so there's an end on't."

In this era of suffragetting and the equal-pay-for-equal-work movement, the poetic truism from the pillar erected on the mount in the Dane John Field, Canterbury, is particularly appropriate.

When the Automobile Dealers' Association of California some time ago decided that it would not hold a show in San Francisco this year, it reckoned without its nemesis—the Progressive California Woman. As was told in the Motor World several of the dealers in the association were in favor of holding a show, while others were against the proposal. Upon putting the question to a vote the opposers of the idea got the decision, but by a very small majority. Then the California Woman's Automobile Club heroically came to the rescue with a decision to hold a show, and as the organization of feminine mahouts had no strings to it, decided it would not ask a Mere Man's association whether or not it might hold a show. The very idea! What was to hinder the women from holding a show if they wanted to? Nothing!

When the dealers' association saw that many of its members intended to exhibit at the women's show and in fact had already secured space, a most remarkable resolution was passed. It was to the effect that those dealers who already had signed for space might exhibit just this once, but those who had not been so fortunate must positively not show their goods at the women's show under penalty of a fine and possible suspension from the association.

The result may be imagined. According to San Francisco advices the Automobile Dealers' Association of California is threatened with disruption. Many of the dealers who were thus shut out by the resolution of the association do not like the discrimination and the first outbreak occurred last week when Charles A. Hawkins, western manager of the White Co., sent a pointed letter to the association, withdrawing from it both as a member and as a director. In no gentle terms he called the managers of the dealers' combination 'dogs in the manger" and also reflected on their business judgment in regard to paying a man $700 for his services in connection with the dealers' show that originally was proposed, but later was called off. He also stated that the president and secretary of the association don't know much about automobiles, anyway, and the latter officer returned the compliment with a public statement to the effect that Hawkins had better attend to his business and not attempt to cast slurs on those who were residents of California when he was a "jay-hawking sewing machine agent in Texas." Another resignation came from A. B. Costigan, manager of the Pacific Motor Car Co.

Regardless of this dispute, the California Woman's Automobile Club seems to have made good with its show. It opened unofficially on Monday afternoon of last week, 2nd inst., with a big parade of decorated cars, headed by a brass band, two prizes being offered for the most attractive cars in line, with another lighted parade in the evening followed by the official opening in the big Coliseum, when Mrs. Fred J. Linz, president of the California Woman's Automobile Club ascended the platform and introduced Mayor Parker Lyons, of Fresno, as the inaugural speaker. The Mayor was followed by Wu Ting Fang, Chinese Minister to America, who complimented the women and said he was glad to see them succeed where men had failed, which statement was rather remarkable, coming as it did from the representative of a country where women always have been kept in the dark background. Minister Wu told of his experience of riding in an automobile in Washington five years ago and remarked at the progress made in automobile manufacture since that time. He caused laughter when he hoped some day to return to his own country in an automobile.

The women did not stop with two parades to advertise their show. By calling Monday night "Boulevard Night," when half of the proceeds were devoted to the boulevard fund that is being raised by the Automobile Club of California, they enlisted the help of that organization. To further stimulate interest in the show, a hill climbing contest was held during the afternoon on the steep hill that leads into the Buena Vista Park section. There were two classes for roadsters, with as many silver cups for prizes, and a large crowd witnessed the contest. Honors in the class for large machines fell to D. A. Bonney, who drove a Stearns up the bumpy stretch of more than a mile in 1:42. H. L. Ownesey, in a Winton, was second in 2:20⅗. In the class for smaller cars Edgar Mason, driving a Tourist, won the cup. Norman DeVaux, Auburn, was second, and Clarence King, Maxwell, had a walkover in the class for runabouts costing under $900. On account of the bad condition of the hill Wednesday's events were postponed until Thursday when inclement weather again made them impossible. On Friday the rain caused a third postponement and from last reports it is doubtful if the events will be held.

While it is to be regretted that the differences relating to the automobile show occurred to disturb the peace of the dealers' association, at the same time it is not to be denied that the women did re-

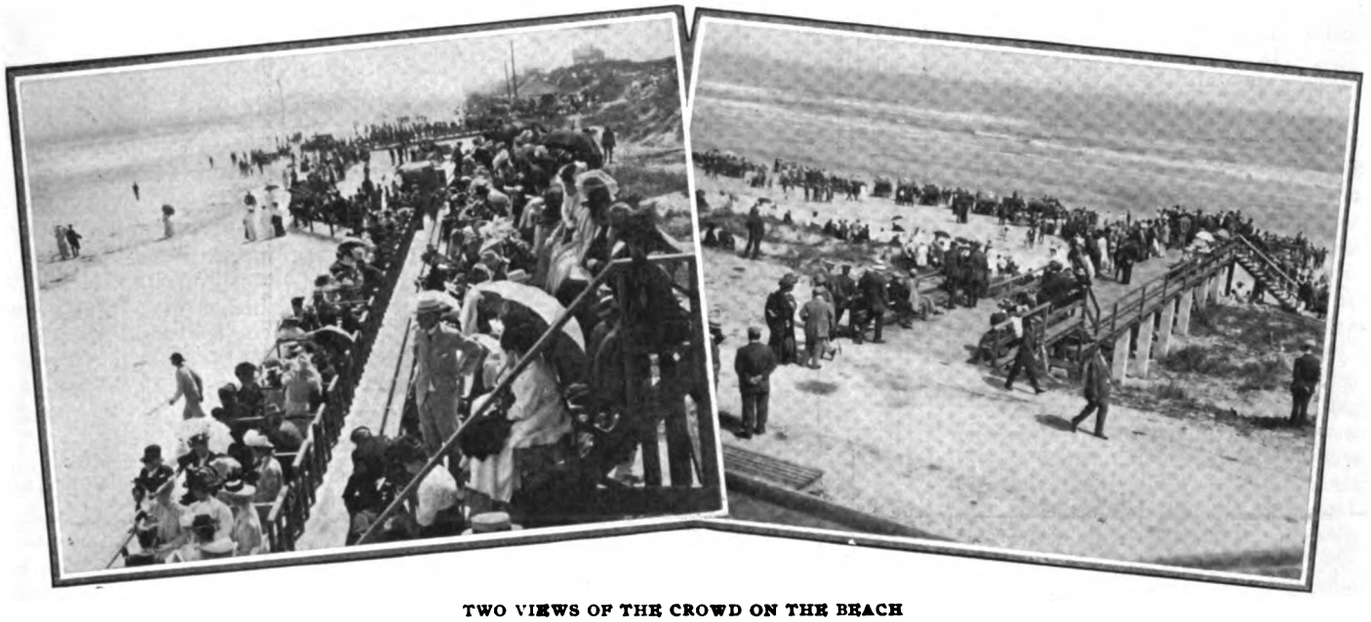
Digitized by Google

markably well in securing as many cars as they did. The Motor and Accessories Association sanctioned the show so that it did not make any difference in the accessories exhibits. At the Coliseum last week 33 makes of cars were staged, as follows:

White, Locomobile, Stevens-Duryea, Winton, Maxwell, Tourist, Acme, Aerocar, Frayer-Miller, Lambert, Auburn, Marion, Woods, Haynes, Chadwick, Dragon, Renault, Glide, National, Gale, Overland, Corbin, Elmore, Heine-Velox, Queen, Taximeter Cab, Brush, Jewel, Imperial, Jackson, Pennsylvania, Rapid and Stearns.

Fifteen agencies, representing nineteen cars, abided by the resolution of the association and did not exhibit at the show. The cars which were not shown were:

Autocar, Buick, Cadillac, Packard, Cameron, Pullman, Ford, Mitchell, Northern, Peerless, Pierce Great Arrow, Pope-Hartford, Premier, Rambler, Reo, Stoddard-Dayton, Studebaker, Thomas and Oldsmobile.



Dealers After the Insurance Men.

Cincinnati's automobile dealers are after those insurance companies that prevented the dealers' association from holding its annual show last month by threatening to cancel the policies of the Music Hall if a show was permitted within the building. The association has appointed a committee to ascertain the names of the insurance companies who made threats of the sort, and to discover the cause thereof. The dealers will then see if there is any objection to holding the show in April and if the companies persist, the tradesmen say that they will cancel their insurance in any such companies. It is said that the dealers are backed up in their move by the Cincinnati Automobile Club, but whether or not this is the case there is no question but that the dealers are in earnest in their endeavor to learn "what's what."

RECORDS FALL ON FLORIDA BEACH

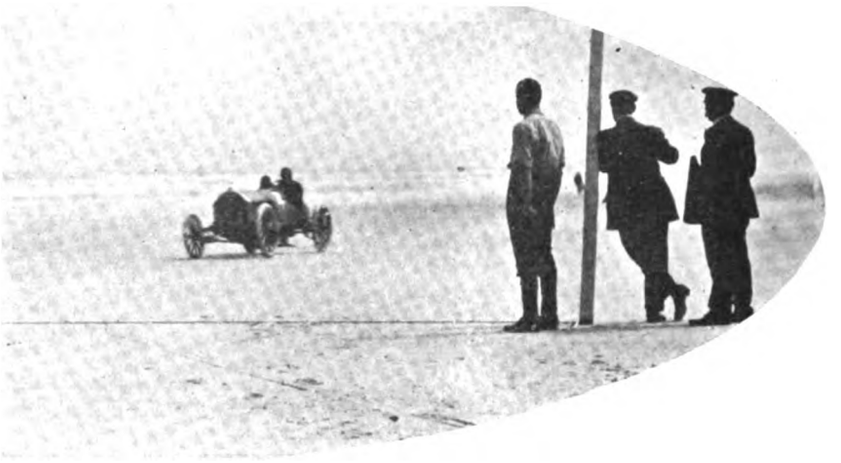
Cedrino Sheds Some Glory on the Carnival —But Racers Were Few and Runaways the Rule.

The closing days of the Florida speed carnival, Thursday and Friday last, 5th and 6th insts., did nothing to pin its fame higher in the skies; and however strong the desire to make it appear otherwise it is evident, as it was stated last week, that the Florida beach meet has lost about all of its one time splendor.

TWO VIEWS OF THE CROWD ON THE BEACH

The only startling performance which occurred on Thursday, was a fast flight by Emanuel Cedrino, in a 60 horsepower Fiat car equipped with Continental tires, when he established a record of 256 miles by covering this distance in the race for the Automobile Club of America's trophy in 3 hours 21 minutes 27⅘ seconds, an average of 77 miles per hour. The closing day saw Maurice Bernin break the 100 miles record by 3 minutes, when he won a match race against S. B. Stevens who, by the way, is classed as an amateur and as such drove in the gentleman amateurs' race two days previously, while Bernin is a paid professional driver. Bernin's time for the 100 miles was 1:12:56⅕. So far as exciting sport goes there wasn't any. All the events were uninteresting runaways, and furnished none of the close finishes that have made other Ormond meets memorable.

The 256 miles race for cars weighing not more than 2,424 pounds for the Automobile Club of America trophy, which was run on Thursday, had only four contestants, Cedrino in the Fiat, Bernin in the 60 horsepower Renault, G. B. Blakeley in a 50 horsepower Christie, and R. G. Kelsey in another Christie. Kelsey professionalized himself by competing against these two drivers; he drove in the amateur race on Wednesday. The race was held over the full beach course of 16 miles, comprising eight laps at 32 miles each.



In the first lap Cedrino stopped to change a tire, and Bernin led at 32 miles in 25:27, Cedrino being then four minutes behind, with Kelsey two minutes behind him. In the second lap Cedrino regained the lead and held it from then until the finish. Bernin had a flat tire and changed it in the third lap and made a second change of tires in the fifth lap. Blakeley had trouble in the first lap and retired in the second. At 100 miles Cedrino's time was 1:21:39⅗, Bernin's 1:37:33⅗, and Kelsey's 1:38:27. When Bernin had his last tire trouble Kelsey passed him and although the young Frenchman made a fast run in the closing miles, he was just beat out for second place by twelve seconds. The following table shows the speed made by each of the three finishers on each lap:

	Cedrino.	Kelsey.	Bernin.
32 miles	:29:16	31:15	25:37
64 miles	54:14	1:01:58	55:22
96 miles	1:18:46	1:34:54	1:33:38
128 miles	1:43:11	2:03:55	1:57:49
160 miles	2:11:34	2:37:58	2:29:41
192 miles	2:34:48	3:08:03	3:17:49
224 miles	2:58:09	3:37:04	3:42:14
256 miles	3:21:27⅘	4:06:26	4:06:38

Driving at an average speed of 82.26 miles an hour Bernin, on a 60 horsepower Renault, won his 100 miles match against S. B. Stevens, in a Fiat, on Friday and broke the record for the distance. Bernin covered the century in 1:12:56⅕; the old record of 1:15:40⅖ was made by Walter Clifford-Earp two years ago.

The match was held over the full 16 miles course and Bernin had the better of the race from start to finish. At the 24th mile the Frenchman had a lead of 2 minutes 48 seconds over the gentleman amteur driv-

Digitized by Google

AT ONE OF THE TURNS OF THE COURSE—TYPICAL VIEW AT AN "EXCITING" MOMENT

er in the Italian car while he gained somewhat in the next leg. Stevens' time at the finish was 1:23:59, or 11 minutes 2⅘ seconds behind Bernin.

The mile event from a rolling start resulted in a victory for Cedrino, who beat Bernin, the only other starter, to the finish by 100 yards. The time was 42⅘ seconds, which was announced as a record for middleweight cars.

The mile record trials concluded the four days' program, and the record of 28⅖ seconds remained unscratched. The best performance in these trials was made by Cedrino, timed in 35 seconds, with Bernin second in 39⅕. Kelsey in a Christie car was timed in 42⅘ in two trials and G. P. Parker, in a Benz car made it in 45⅗. The summaries:

100 miles match between Maurice Bernin (60 horsepower Renault), and S. B. Stevens (60 horsepower Fiat)—Won by Bernin. Time, 1:12:56⅕.

One mile open—Won by Cedrino (60 horsepower Fiat); second, Bernin (60 horsepower Renault). Time, 42⅘.

One mile record trials—Cedrino, 60 horsepower Fiat), 0:35; Bernin 60 horsepower Renault), 0:39⅕; Kelsey, (50 horsepower Christie), 0:42⅘; Parker (80 horsepower Benz), 0:45⅗. W. H. Wray, Jr., (14 horsepower Pengeot motorcycle), 46⅖, flying start; 50⅖, standing start.

Serving as a final wet blanket to the Ormond speed carnival, three, or maybe four,

CEDRINO, THE HANDSOME RECORD BREAKER

or possibly five cars are making a run down the east coast of Florida from Jacksonville to Miami. It is called an endurance run. There are seven prizes. The distance is 371.8 miles. The run started on Monday and is supposed to finish to-morrow (Friday). The first day's run was from Jacksonville to Ormond, 84 miles, and of the unknown number that started only two cars arrived at that place, the Cadillac runabouts owned by Charles Nolan and Dr. Stinson, respectively. On Tuesday, Nolan's Cadillac and C. F. Wheeler's Peerless reached Rockledge, 74.5 miles, the cars arriving there within an hour of each other. Nothing has been heard of the other cars up to the present time.

World's Records on Brooklands Track.

Although it was thought that the staggering record set up on the Brooklands track a few weeks ago when Charles Jarrott covered 50 miles in 36:05 76-100, an average of 83 miles an hour, would stand for some time to come, it did not remain on the slate two weeks. On the 19th ult., Newton, driving a 60 horsepower Napier, set out to break the two hour record. Fifty miles were covered in 35:07 36-100, an average of 85.4 miles per hour, and the time for 100 miles was 1:10:20 31-100, averaging 85.3 miles. In the hour 85 miles 555 yards were covered. Newton's time for 150 miles was 1:46:06 17-100, and in two hours he had covered 169 miles 615.6 yards, a performance that almost staggers belief.

WHAT HAPPENED TO ONE OF THE NON-CONTESTING CARS

RECORD BREAKING AT ALTADENA

Apperson Climbs Hill at a 52½-Miles Clip—Derkum Gives a Sensational Motorcycle Performance.

Record breaking performances, a fast course, capable management and a big crowd, marked the third annual Pasadena-Altadena hill climbing contest held Saturday afternoon, 29th ult., by the Automobile Dealers' Association of Southern California. P. J. Q. Derkum, who broke several world's motorcycle records at a motorcycle meet in Los Angeles a week before, furnished the sensation of the day when he streaked up the hill in the marvelous time of 1 minute 17 seconds. This is at the rate of 65 miles an hour over a course measuring exactly 1.35 miles, and that rises from 3 to a 14 per cent. grade, besides containing three turns. The other sensation was the driving of Edgar Apperson, who drove two events in 1:36¼. This is at the rate of 52½ miles an hour, the fastest time ever made over the course by an automobile, but somewhat slower than the record-breaking flight made by Derkum on a two-cylinder motorcycle.

The course was in excellent condition and probably five seconds faster than at previous contests. The work of the Altadena Improvement Association was manifest, and chuck holes were conspicuous by their absence. That bugbear of former contests—the electric railway crossing—was bridged by a wooden platform, which allowed the cars to cross at full speed without bounding off the ground as they formerly did. The ten events were run without a hitch of any kind and were disposed of in one hour and thirty-five minutes. The course was well patrolled and the deputies had no trouble in handling the crowd of 5,000 or 6,000 people that lined the highway.

As only one car showed up for the first event it was scratched from the program and a special event for motorcycles was substituted, W. G. Collins and Paul J. Q. Derkum, both on two-cylinder Indians, appearing at the tape. This was the most sensational event of the day. Collins got the word first and was away like a shot, Derkum following fifteen seconds later. At the first turn Collins was obliged to make a wide detour and in doing so he grazed an automobile, his fingers getting a hard knock, while half of the handle bar was wrenched off. This did not seem to daunt him in the least and he continued with increasing speed. A few seconds later a similar experience befell Derkum. He also skidded on the turn and hit the fender of an automobile. According to Los Angeles advices one-half of the handle bar of his machine was torn off and his fingers were badly lacerated, but like Collins, he held his seat and continued to the finish, with blood dripping freely from his hand. The result is shown in the summary. Both Collins and Derkum made the fastest flight ever witnessed over that upgrade from the gardens of Pasadena to the poppy fields of Altadena.

The last two were the most thrilling of the automobile events. Six of the fastest cars in Southern California lined up for the event for roadsters costing more than $3,000. The Apperson, driven by Edgar Apperson, won easily in 1:36¼, with the Stearns second in 1:58. The last event was for the four cars that had made the fastest times in the previous events and was in the nature of a final heat to decide the real champion of the climb. It was unusual in that Apperson won again and duplicated his time made in the previous event to a fraction of a second. The Stearns was again second, but in better time than in the previous race.

All the events were closely contested. That for touring cars costing from $1,000 to $1,500 went to the Tourist in 2:41, and Leon T. Shettler's Kiselkar won in the class from $1,501 to $2,000. W. K. Cowan, Rambler, won a popular victory when he got the prize in the event for cars costing from $2,001 to $2,500. His time was 2:27. An Oldsmobile entered by the H. O. Harrison Co. took the next event in 2:25, while Shetler, in his Kisselkar pocketed another cup by driving up the hill in 2:22¾ in the event for roadsters costing $3,000 and under. The summary:

For Motorcycles.

1 Paul J. Q. Derkum, Indian 1:17
2 W. G. Collins, Indian 1:35

Touring Cars Costing $1,000 to $1,500.

1 Auto Vehicle Co., Tourist 2:41
2 Leon T. Shettler, Reo 2:54
3 Western Motor Car Co., Buick... 2:56

Touring Cars Costing $1,501 to $2,000.

1 Leon T. Shettler, Kisselkar 2:46¼
2 H. O. Harrison Co., Oldsmobile .. 2:51¾
3 Auto Vehicle Co., Tourist 2:52½
4 A. W. Gump, Jackson 2:55

Touring Cars Costing $2,001 to $2,500.

1 W. K. Cowan, Rambler 2:27
2 White Garage, Pope-Hartford ... 2:35
3 Leon T. Shettler, Reo 3:04
4 Elmore Motor Car Co., Elmore... 3:55

Touring Cars Costing $2,501 to $3,000.

1 H. O. Harrison Co., Oldsmobile .. 2:25
2 Auto Vehicle Co., Tourist 2:30½
3 Western Motor Car Co., Thomas. 2:40½

Touring Cars Costing $3,001 to $4,000.

1 Western Motor Car Co., Thomas. 4:37½
2 White Garage, White ....

Roadsters Costing $3,000 and Under.

1 Leon T. Shettler, Kisselkar 2:22¾
2 Stoddard-Dayton Motor Car Co., Stoddard-Dayton 2:32¼
3 Auto Vehicle Co., Tourist 2:41½
4 Leon T. Shettler, Reo 2:58¼

Roadsters Costing $3,001 and Over.

1 Edgar Apperson, Apperson 1:36¼
2 W. J. Batchelder Co., Stearns 1:58
3 Ralph C. Hamlin, Franklin 2:00
4 Western Motor Car Co., Packard. 2:09¾
5 White Garage, Pope-Toledo 2:20
6 Woodill Auto Co., Haynes 2:30½

Special for Four Fastest Cars in the Nine Events.

1 Edgar Apperson, Apperson 1:36¼
2 W. J. Batchelder, Stearns 1:54¼
3 Ralph C. Hamlin, Franklin 1:57¾
4 Western Motor Car Co., Packard. 2:12

The Message Delivered to Loughborough.

The message has been carried to Loughborough—Colonel Robert H. R. Loughborough, commander at Fort Leavenworth, Kansas. The message, which took the form of a letter of salutation from General Frederick Dent Grant, in command at Governor's Island, N. Y., was started from New York City on Tuesday, 18th ult., in an attempt to demonstrate the value of the automobile in carrying dispatches between army posts in time of war. In this case the message was carried in a 30 horsepower Studebaker, driven by relays of drivers. As has been detailed at length the car encountered heavy obstacles to its progress in the shape of huge snowdrifts between New York and Chicago, and after leaving the Windy City got into deep mud that was even worse than the snowdrifts. The further it went, the deeper became the mire and it was only by digging their way by inches for two days through two feet of heavy mud near Atchison, that the Studebaker crew managed to reach Fort Leavenworth at 11:32 o'clock Saturday morning last, 7th inst., having been exactly 18 days 2 hours and 32 minutes on the road. The entire garrison turned out to escort the mud covered car and its drivers into the fort.

Hudson County Club Plans Active Work.

The Hudson County Automobile Club, which has its headquarters in Jersey City, N. J., held its annual meeting last week, at which it was decided to join any movement against unfavorable legislation at Trenton. The following officers were elected: President, J. V. Z. Anthony; vice-president, John P. Landrine; secretary-treasurer, F. D. Laughlin; directors, J. H. Edwards, H. P. Pond, Herbert Scott, E. M. Dixon, and Dr. L. A. Opdyke. The following committees were also appointed: Membership—H. P. Pond, Alfred H. Howe, E. P. Dixon; good roads, George E. Blakeslee, J. H. Edwards, William E. Smith; auditing, Herbert Scott, E. B. Kierstedt, Dr. W. L. Pyle.

Spokane Club Changes Name.

Henceforth the Spokane (Wash.) Automobile Club will be known as the Spokane Motor Club, the change in title being effected at the last meeting. Louis Schermerhorn was elected president and Dr. C. B. Setters was chosen vice-president. W. S. Dulmage received a majority of votes for secretary, but as he declined the office was left unfilled for the present.

JERSEY MOTORISTS SPOKE PLAINLY

Convention of Club Delegates Discusses Proposed New Laws—Senator Frelinghuysen Replies to Questions.

Although some of the less hopeful individuals had prophesied that the presence of State Senator Joseph S. Frelinghuysen at the conference of delegates of the automobile clubs of New Jersey, relative to the iniquitous amendments to the present automobile law which the senator is endeavoring to have passed, held in Newark last Friday night, 6th inst., would have a tendency to make some of the delegates bashful and afraid to unburden their minds, such was not the case. Of the more than 300 representatives present each was eager to give Senator Frelinghuysen his opinion of the law and the proposed amendments.

The resolutions that were passed favored the law compelling all vehicles to carry a light at night, which is Senator Frelinghuysen's amendment to the good roads act and which, by the way, already had been passed by the Senate. His other measure amending the crimes act, making it a misdemeanor to throw glass or other sharp substances upon the highway, and also his efforts to compel justices of the peace to pay over to the States promptly all moneys collected in fines, were also commended and resolutions were passed accordingly.

Other parts of the amendments were opposed by the automobilists, who adopted resolutions favoring the extension of free tourist privileges to non-resident motorists; opposing the proposed license fee, and declaring for an increase of the speed limit to 30 miles an hour. Resolutions also were passed commending Commissioner J. B. R. Smith for his administration of the department of motor vehicles, and condemning the proposed plan to separate the department, and also one opposing a change in the dealers' license clause.

As is quite generally known, the amendments introduced by Senator Frelinghuysen consist of a sliding taxation of vehicles based upon horsepower, from $3 to $100 per year; a sliding scale for drivers' licenses, from $1 to $25; the granting "admission tickets" to non-resident motorists to use New Jersey's roads, at a cost of 50 cents per six days, and the abolition of manufacturers' and dealers' blanket licenses, besides several other minor changes.

W. C. Crosby of East Orange, N. J., opened the meeting and stated that it had been called to discuss the proposed amendments and to allow the originator of them to hear the automobilists' opinions. Each point in the proposed amendments was discussed at length and each of the eight resolutions were adopted unanimously.

Senator Frelinghuysen did not appear in the least disturbed by the criticisms, some of which were extremely harsh. He joked with the automobilists and thanked them for their frankness. He was hailed as an automobilist and at the same time berated for his political ambition in playing for the farmers' vote, notwithstanding his insistence that politics should be eliminated from the question of motor vehicle legislation, and went on to explain that in framing the amendments he was actuated only by his idea of the need of the people at large, and that Governor Fort's suggestions were in accord with his own opinions.

After finishing his remarks, the Senator was asked by Dr. J. N. Faulkner, of the North Jersey Automobile Club of Paterson, if he had ever violated the 20 mile speed ordinance.

"I might ask the doctor the same question," responded the Senator.

"Answer mine first," retorted Faulkner.

"Never wilfully, and not knowingly," was the answer from the Senator, which was greeted with laughter. Dr. Faulkner's only answer was that he had heard that the father of the automobile law traveled faster than 20 miles an hour every time that he went out in his car. "He ought to know by this time," said the doctor, "that it would be impossible to keep within the limits."

Richard C. Jenkinson stated that the Newark Board of Trade was interested in the question from an industrial standpoint. He said that the automobile industry was of vital importance to the city and State from the fact that every part of a motor car was manufactured in Newark and that thousands of people were kept employed and added that although there were members of the Board who were opposed to automobiling, the organization was willing to take sides with the automobilists in their fight against unjust legislation. Mr. Jenkinson criticized the law which shut out tourists from other States which allow the Jerseyite the free privilege, but Senator Frelinghuysen did not explain how much he paid in taxes to the State of New York when he maintained an office in New York City and an uptown home and operated an automobile in New York when fighting so vigorously for the automobile law now in force in New Jersey. The Senator's letter heads at that time bore a New Jersey address, and appeared to be his chief qualification as a resident of that State.

Bingham Wants to Select Police Cars.

Commissioner Bingham, of the New York Police Department, is not so anxious as he once was to purchase motor cars at public letting. He desires to obtain two more of them at a cost of not to exceed $8,000, and has asked the board of aldermen to permit him to buy them without advertising for bids. He says such action is necessary as the five passenger touring cars desired are "manufactured under patents." It is generally understood that the cars which the Police Department has been led to desire are Loziers.

RESURRECTION OF AN OLD BUGABOO

Outcry About Automobiles Damaging Roads an Echo of Early Bicycle Days — Page from History.

If, at this time, any person attempted to assert that the bicycle caused injury to the roads, probably he would be considered a candidate for an insane asylum. If the politicians are to be believed, it is only the automobiles that do damage to the highways. That this latter cry merely is in the nature of history repeating itself is well instanced by the reproduction of a letter which appeared in a Terre Haute (Ind.) paper in 1886, and which reflected the official opinion of that date, which was to the effect that the 50 pound bicycles of that period were destroying the roads exactly as the 5,000 pound automobiles of to-day are accused of doing. The letter in question, signed "Cyclist," was as follows:

"Editors Gazette—Yesterday's issue states among the "Court House Echoes," that the county commissioners have asked our county attorney for an opinion in regard to prohibiting bicycles from being used on the grade west of the river bridge, giving as their reasons that such bicycles are cutting up the splendid roadbed of said thoroughfare. The commissioners have evidently never been near enough to a bicycle to ascertain that a 'soft rubber tire' encircles the felloes of each wheel. In what manner that soft rubber can cut up a hard roadbed is as yet an unsolved mystery, which our worthy commissioners can probably explain best. It may just as well be claimed that one can cut plate glass with the end of their finger, with just as much plausibility.

"The commissioners could have saved Attorney Long the trouble of looking up the law on this subject, as scores of test cases have been tried before the courts in as many different localities and states, and (with but one single exception) the decisions have been to the effect that a bicycle is a 'carriage used as a means of conveyance, consequently is entitled to the same privileges and restrictions as other vehicles used on our public highways.'

"Not wishing in the least to question the sincerity of our commissioners in this matter, it has been left for them to be the 'first' to put forth this most ludicrously absurb plea of bicycles cutting up hard roadbeds; therefore they ask counsel if these bicycles can be kept off a certain road."

Warren Automobilists Form a Club.

Automobilists of Warren, Ohio, have formed the Warren Automobile Club with the following officers: President, W. H. Dana; secretary, Harry J. Love; treasurer, Dan A. Geiger. The club will institute an active campaign for new members.

AMERICAN CAR AT BITTER CREEK

Its Long Lead in New York-Paris "Race" Bitter for Europeans—Plan to Ship the Cars is Forbidden.

With E. Linn Matthewson in the driver's seat, Edward Schuester at his side, and Captain Hansen in the passenger's seat, the Thomas car reached Bitter Creek, Wyoming, at 9 o'clock last night (Wednesday) on its way to Paris, having covered 2,300 miles from New York City. The Italian Zust car, in charge of Sirtori, was reported at Ogallalla, Neb., 1,878 miles, with the De Dion, St. Chaffray at the wheel, at Boone, Iowa, nearly a thousand miles behind the American car. The German Protos car, which is now in command of Lieutenant Koeppen, Knape and Maas having got their fine feathers ruffled and started back to Europe, was reported from Cedar Rapids, Iowa, 1,262 miles. Unfortunate Godard is laid up at DeKalb, Ill., with a broken sprocket. The Motobloc car, which was the only one equipped with solid tires, has been having all kinds of trouble over the rough western roads, and it is reported that Godard will equip his car with pneumatics before proceeding further. All the other cars are fitted with pneumatic tires, those on the leading Thomas being Diamonds.

It has been remarked that Godard evidently has seemed in no hurry to cross the continent, being content to remain far in the rear. This week an explanation was received from Paris. Since Godard left Paris, the report states, he has been sentenced to eight months' imprisonment and the repayment of 5,000 francs alleged to have been obtained under false pretence during the Pekin-Paris trip last year. On account of this Godard is in no hurry to reach Paris.

The Thomas car has been making good progress since it left Cheyenne, Wyo., last week. At that place, Montague Roberts turned it over to E. Linn Matthewson, of Denver, who enjoys a reputation as a race driver. Montague Roberts, who piloted it that far returning to New York City, as he is entered in the Briarcliff trophy race in April, and the Grand Prix in July. The Denver driver will take the car to San Francisco, when it will be given over to Schuester and Captain Hans Hansen, who as stated last week, forsook the De Dion crew and made arrangements with the Thomas company to pilot the American car through Siberia, which country is thoroughly familiar to him.

It developed this week that at least three of the foreigners had no intention of traveling all the way across the American continent by the power of their own cars. There existed, according to reports from Chicago, a sort of "gentleman's agreement" to ship the cars by rail to Seattle or San Francisco and then take the boat to Alaska, thereby starting from there on even terms. When this determination was cabled to Paris for confirmation the answer showed that at least the Parisian newspaper promoting the contest is "on the level." It was brief and to the point, and made it plain that the first car that took a railroad train would be disqualified. Naturally, it was a disappointed lot of foreigners that reluctantly set out after the American car far in the lead.

With the exception of the American entrant, all the other contestants have reported trouble. The De Dion car was laid up three days at Cedar Rapids with a broken crank shaft, and had more trouble at Marshalltown, a few miles further on. The Zust car broke a sprocket and a spring but was repaired in the Union Pacific shops at Omaha. The squabble that arose between the members of the German crew on the Protos car was of the same nature that separated St. Chaffrey and Hansen a week previously. Each wanted the credit of doing all the work, but as Lieutenant Koeppen was recognized as the leader of the party, having been commissioned by the German military authorities to take the car through to Paris, he got his name in the papers more often than did Knape and Maas. The latter two then "got their dander up" and are now on their way back to New York to return to Germany.

According to E. Leroy, Pelletier, who last week returned from abroad, the New York to Paris race, already a joke on this side of the water, is going to cause much sadness in Europe. It was expected to prove the immense superiority of the European cars, and to bolster the market for them on this side of the water. Unfortunately, the cars that were sent across to

THE MOTOR CAR AS AN AMPHIBIOUS CRAFT.

STREET SCENE IN DETROIT DURING A RECENT FLOOD

Digitized by Google

make the run were built for the fine roads of Europe, and not for the ruts and trails of American wildernesses. Hence their utter failure. Mr. Pelletier spent three years in Alaska, and laughs at the idea of driving an automobile in that country.

Favors Automobiles for Newspaper Mail.

"There is one class of mail matter that should not be neglected and that cannot be neglected," declared Postmaster Morgan, of New York City, at the annual meeting of the New York State Association of Postmasters, held on Wednesday last, 5th inst. "That is the class which includes the newspapers and periodicals. As we deliver that mail now we have to depend upon wagons. It is my opinion that automobiles should be used. Whether the automobile can be relied upon for this service will be up to the department at Washington, but I believe that the automobile has reached a point of service that warrants its test as a factor in the postal service of the United States." Postmaster Morgan emphasized the fact that if the government does not authorize the use of automobiles for delivering newspapers and other bulky mail matter it will have to discover some other swifter means than by delivery with the slow-going horse and wagons.

Nixon's Dream of Rapid Travel.

It was a rosy view of the automobile's future that Lewis Nixon spread before the members of the Richmond County Automobile Club in his after dinner speech at their annual banquet at St. George, Staten Island, on Saturday night, 7th inst. "I predict," he said, "that in the near future automobiles will be an accompaniment of every home, the same as the old red wheeled buggy. The great department stores will have automobiles with bodies which may be removed from the chassis and another body placed thereon and no time lost."

Then Mr. Nixon proceeded to forget all about speed limits, especially in New Jersey, where scorchers encounter justice in its sternest aspect, for he added to his predictions the declaration that "in a short time cars will be built capable of making a speed of 175 miles an hour, so we may expect to travel from New York to Philadelphia in a few minutes."

Newark Already Talking of Next Show.

Because of the success of its recent show, the first of its kind held in Newark, N. J., the New Jersey Automobile Trade Association and the New Jersey Automobile and Motor Club already have begun to talk about holding a show in 1909. It was stated this week that arrangements already had been made to hold the next exhibition in the Essex Troop armory, which will be completed some time this year, the exhibition hall at Electric Park having proved by reason of its limited space entirely inadequate for the show which was held there this year.

TIRE MAKERS HANDLE TAXIMETERS

American Device Placed on the Market in a Combination Offer—Details of the New Appliance.

First of the American taximeters to be completed and put on the streets is the one made by the Westchester Appliance Co., which it transpires will be marketed through the Ajax-Grieb Rubber Co., of which Horace De Lisser is president. Announcement of this fact has served to bring

TAXIMETER WITH FLAG UP

out that the latter company is making a combination offer on tires and taximeters to owners and operators of taxicabs.

The first order reported is for 2,600 of the instruments at a fare of 50 cents a mile, with another order pending where the charge will be 30 cents for the first half mile, and 10 cents for each additional quarter mile, which is the prevailing rate in New York. On both of these orders there is a charge of 10 cents for each six minutes of waiting. The higher priced meter is to be for a company which figures on a service de luxe.

TAXIMETER WITH FLAG DOWN

The Westchester taximeter indicates the number of trips; the total cash for the day; the total number of miles covered and each individual fare. Moreover, by a unique device it is arranged that when there is any discussion regarding fare after the occupant leaves the cab, there is no chance of the driver allowing the fare to be running up. This is accomplished by a further lowering of the flag.

The taximeter is made under patent No. 760,125, owned by the Taximeter and Cab Company of America, and the selling rights are controlled by the Ajax-Grieb Rubber Co. It will be handled by all branches of this company which has its New York headquarters at Fifty-seventh street and Broadway.

The ilustrations show two views of the taximeter reproduced from a complete instrument.

His Fine Came Back Fourfold.

Being fined $20 for exceeding the speed limits and making a profit of $60 by the adventure is not the experience of every automobilist. It did happen, however, to Richard Stevens Eskridge, a Seattle lawyer who was touring in Southern California. A motorcycle policeman started the story when he arrested Eskridge for speeding in the suburbs of Los Angeles. Eskridge fumed and swore, but to no avail. The officer was obdurate and the Seattle man was compelled to give bail for his appearance in court next day. Voicing maledictions upon the Los Angeles county officials Eskridge appeared in court the next day and had to leave $20. He did not have the change, but threw down a $50 bill and in exchange was released from custody and received a number of pieces of coin, including a $10 gold piece. The gloom began to lift after that. Eskridge walked into a curio store to purchase a souvenir of his trip and after a selection laid down the $10 gold piece in payment. The curio dealer examined the coin closely. Then he became interested. Inquiring the cause of the agitation Eskridge was told that the coin was dated 1849 and was one of the very rare coins minted in California. The talk ended when the dealer offered Eskridge $80 for the coin. Eskridge figures that the $20 paid for speeding his car was well invested.

Big Roundup of Scorchers.

Donning plain clothes, New York City's motorcycle and bicycle police force, went out for a "killing" an Thursday last, 5th inst. As a result of the hunt 61 chauffeurs were bagged, most of whom were bound over for trial in Special Sessions. The only driver let go was Dr. Joseph A. Mulholland, who explained that he was trying to beat the stork when arrested. Magistrate Breen thought the arrest of the doctor was rather one-sided as the stork had not been arrested also, so he let Dr. Mulholland go.

Royalty Blows the Gabriel Horn.

If it were located on "the other side," the Gabriel Horn Mfg. Co., Cleveland, O., would be able to adorn its stationery with a whole row of royal crests. According to their advices, the Gabriel horn has found its way into the royal garages of the United Kingdom, Germany, Prussia, Spain, Italy and Russia.

FOR TESTING COIL PERFORMANCES

Heinze Describes His Apparatus at Boston Meeting of Engineers—How It Determines Ignition Requirements.

To the average motorist, as, indeed, to many a self-styled expert, the ignition system of the modern car is an all but impenetrable mystery. Hence the average individual with the troubles of his own which, happily are fast vanishing with each year's improvements, is not properly equipped to appreciate the difficulties which beset the path of the manufacturer of ignition devices. The nature of these difficulties and some of the methods which are employed in overcoming them are set forth in a paper read by J. O. Heinze before the Society of Automobile Engineers at its Boston meeting this week.

Speaking of the ideal requirements for igniting the charge in the internal combustion motor, the author remarks that "what is needed is a very hot spark, of great frequency, positive, and of a certain length, to penetrate the gap in the spark plug which is generally from 1-64 to 1-32 inch." As the compression is increased, it is necessary further that "the spark should be longer and of a higher voltage, or to be more precise, it requires a good ½ inch spark to jump a 1-32 inch gap at 90 pounds compression, and only a ¼ inch spark at 60 pounds.

"The heat of the spark depends entirely upon the watt energy consumed in the arc of the gap, or in other words, the sum of the voltage multiplied by the amperage passing through and across the spark gap," he continues. "But since the voltage across the spark gap becomes practically nothing after the resistance of the gap is broken down and the arc formed, the amperage then depends entirely upon the ohmic resistance of the secondary of the coil and the total energy induced in the secondary, and this energy again depends upon the mass and quality of iron in the primary, the ampere turns on the primary core, producing a certain total magnetic flux and the rapidity with which the primary current is interrupted, and from this analysis it would appear that the larger the iron core, or the larger the coil, the hotter the spark to be obtained. Quite true, but we must figure on the frequency of the spark necessary to operate an engine at high speeds, and here we meet with a limitation in the size of spark coils practical for gas engines.

"We find that we have got to magnetize and demagnetize the primary iron core to produce an induced current in the secondary and as the iron core and its vibrator have a fixed time lag, depending upon the mass of iron in the core, the mass of the vibrator and the length and tension of the vibrator spring, we can therefore produce only a certain number of sparks per minute in a certain size coil, as a certain frequency is necessary for a definite engine speed. This frequency would then determine the size of the coil, and the size of the coil determines

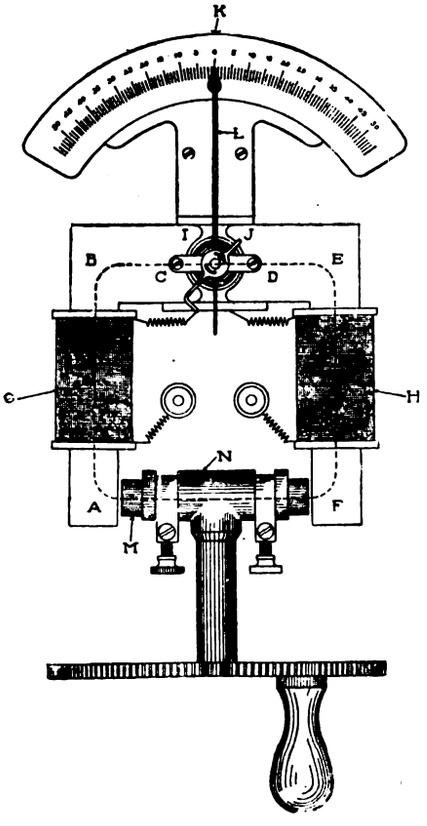

FIG. 1—HYSTERESIS TESTER

the total electrical energy which can be produced by it in the heat of the spark."

With a magneto, as he explains, no such limitations exist. Furthermore, he states the opinion, based on experience, that the "spark coil using a vibrator operated by either a battery, magneto, or small electric generator, will never produce the same results, or efficiency, produced by a magneto operating through a mechanical electrical make and break in the cylinder or on the magneto and stepping up the voltage for jump spark ignition through a non-vibrating induction coil."

For the purpose of studying the requirements of the automobile ignition coil, as well as of testing the efficiency of various kinds of coils, the author has contrived

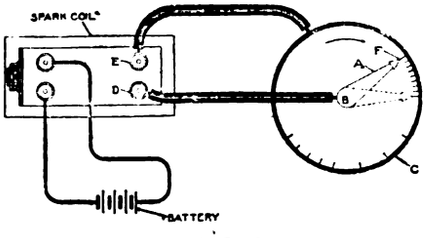

FIG. 2—FREQUENCY INDICATOR

and employed several forms of special apparatus. Of that shown in Fig. 1, he says:

"For the purpose of testing the magnetic quality of the iron and its ability to quickly magnetize and demagnetize, I designed . . . . . a 'hysteresis tester,' which consists of an iron core, A, B, C, D, E, F, of U-shape. On the cores A, B, and E, F, are wound small coils G and H, and between the pole pieces, I and J, is mounted a small circular iron core. Around this core moves a small coil of wire pivotly mounted to which is fixed an indicating needle, L, moving over a graduated scale, K. Small non-magnetic clock springs are secured to the coil pivot and keep the needle at zero. A direct current from a battery producing a certain number of milliamperes passes through the moving coil on its pivot and through the coils G and H in series. The iron core, M, of the spark coils to be tested is revolubly mounted between the cores A and F and completes the magnetic circuit.

"If we now pass a certain number of milli-amperes through the coils G and H and the pivot coil, the iron core to be tested remaining stationary in the position shown in the diagram, we then get a certain deflection of the needle, L, over the dial, K. If we now rotate the iron core, M, about its axis at a fixed number of revolutions we then get a new reading on the scale. The magnetism generated by the current in coils G and H and passing through the rotating iron core in the direction as indicated by the dotted line, reverses in direction through the rotating core twice during every revolution. If we now rotate this core 2,000 revolutions per minute we would get 4,000 reversals of magnetism. The number of degrees of deflection of the needle on the scale depends upon the strength of the magnetic field, and if the iron core does not readily demagnetize and magnetize during its revolutions it would naturally reduce the total strength of the magnetic field and the indicator would show a small reading on the scale. So by this method we can show absolutely whether an iron core is susceptible to rapid magnetic changes necessary for producing a coil to give a great frequency of sparks per minute, and for the purpose of seeing that our iron is twice alike, for if it is not, repeated annealing will usually make it so.

"To test the frequency of the sparks from a coil I designed the instrument shown in Fig. 2, which consists of a rotating needle A, on its axis, B, within a graduated ring, C, of a known diameter and divisions. One end of the secondary, D, of the coil connects to the rotating needle, A, and the other end of the secondary, E, connects to the ring, C. The needle, A, at its point, F, is separated ¼ inch from the ring, C, so that sparks leap across this gap from the point, F, to the ring. If we now rotate the needle a certain number of revolutions and we have a certain circumference in the ring, by multiplying the number of the sparks per inch, times the number of inches in the circumference of the ring, times the number of revolutions of the needle, we then get the number of sparks per minute.

Digitized by Google

"Fig. 3 is an instrument for measuring the approximate temperature of the spark of different spark coils and magnetos. This is not determined in Fahrenheit degrees, but in heat units. The instrument is designed on the principle of utilizing the expansive effect of a hot wire to move an indicator needle over a graduated dial, and is constructed as follows: A fine copper wire is stretched between the metal contact posts, A and B, the tension of this wire being regulated by the adjusting screws, K, and K'. To the center of the wire at C, is fastened a small copper stud which comes to within 1-32 inch of the metal plate D. The secondary terminals of the spark coil are connected to the binding posts L and M, completing its electrical circuit through the copper wire N, across the gap at C, to plate D.

"If a certain amount of primary current, determined by an accurate ammeter, is passed through the coil, we will get a continuous secondary spark between the stud C, and the plate D. This spark heats the stud and in turn heats the copper wire which expands and causes an elongation in the direction of the arrow E. To the center of the wire and the stud, C, is also fastened a small wire, to the end of which is fastened a silk thread, wound around a pivot and kept taut by a small spring, H. To the pivot is fastened an indicator needle moving over a dial, I, in the direction of the arrow, G, when the wire is expanding, and in the opposite direction when contracting, giving us a certain reading depending entirely upon the temperature produced in the copper wire by the heat of the spark at the gap, C. When the rate of cooling, or radiation, of the wire equals the production of heat from the secondary current, the needle will then come to a stop and no fixed time measurement is necessary. In order to test various coils, it is first necessary to see that they all consume the same amount of primary current at the same voltage. . . . .

"Fig. 4 is an instrument for measuring the amount of lag in the secondary spark from the moment the primary current is closed, and my object in designing this instrument was to clear up a prevailing idea in the minds of many automobile operators, that by advancing the timer an early ignition is produced when the piston is still coming up. From the many experiments which I made in ignition timing, I found that it was impossible to advance the spark more than 10 degrees at an engine speed of 1,000 r.p.m. without observing a slight decrease in power; if the advance was carried further, the engine would gradually come to a stop, or kick back. The higher the engine speed the more the spark can be advanced, but no such advance is possible as would be indicated by the position of a timer apparently capable of a movement of 90 degrees, or more. This great amount of advance of the timer is necessary to overcome the enormous lag in vibrating spark coils, but no such advance is possible with a magneto, for the secondary spark takes place immediately at the moment of the primary current interruption. The only

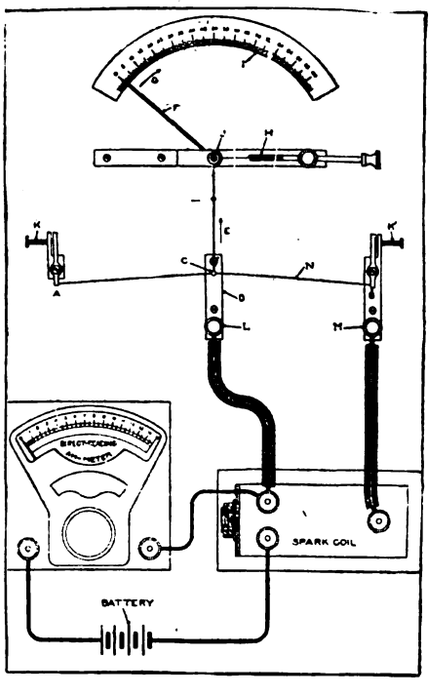

FIG 3—HOT WIRE PYROMETER

lag present is entirely magnetic, and there is none in the contact, for the mechanically operated contact breaker in a magneto increases in speed with the engine, but the vibrator of a coil has a fixed lag, or in other words takes just as long to start vibrating, whether the engine is running 100, or 2,000 revolutions and it should respond more rapidly at high speeds than at low, but it is apparently impossible to make such a magnetically operated make and break in the form of a vibrator.

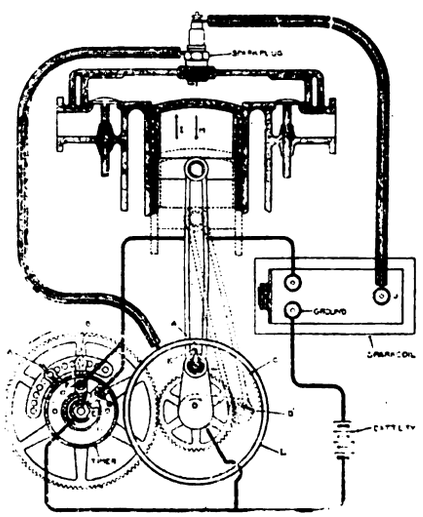

FIG. 4—TESTER FOR IGNITION ADVANCE

"The instrument for demonstrating this advance spark theory consists of a model of a gas engine with its cylinder and piston, connecting rod and crank, but secured to the crank pin is a small pointer, K, which rotates within a metal ring, L, clearing it about ¼ inch. The wires from the secondary of the spark coil are connected to the insulated metal ring, L, and to the crank and pointer, K, so that the spark will jump from the pointer K, to the ring L, while the engine is in operation. We now set the timer in such a position that in turning over the engine slowly by hand in the direction shown by the dotted lined crank, we will get a spark when the crank is at the point of maximum compression, as shown in the diagram. If the engine is now speeded to 1,000 r.p.m., without moving the timer, we would find the spark jumping across at B, or in other words, it would be 90 degrees late. This lateness of the spark is entirely due to the lag of the vibrator and the magnetic lag of the iron core, and we must advance the timer an equivalent amount to balance up the two. By varying the speed of the engine, the spark moves from the position A' to B'. My object in designing this instrument was to prove that the ignition in a gas engine should take place at the highest point of compression, and it approximately does so when the engine develops its greatest power, also that the time required to ignite the charge is very small and never requires more than a few degrees of advance."

Effect of Bad Weather on Sales.

"You would hardly expect weather conditions to have any material bearing on the sale of a car, yet in many a case it has been my experience that an unexpected 'bad' day has ruined my chances of a sale which otherwise might have been almost a foregone conclustion," says a New York salesman of no small experience in such matters. "It is not as you might at first suppose, that bad weather makes bad roads, and bad roads interfere with the smooth demonstration we always used to be so crazy to give the 'prospect.' The fact of the matter is that when we get hold of one of those pestiferous 'doubting Thomases' who never can quite make up their minds between the respective merits of the Nile or the Congo cars, we always dread a rainy or snowy day. For just as sure as one comes, some 'friend' will get hold of him and point out the advantages of some other machine. Whereas if it is pleasant, we can generally swing him our way."

San Francisco Dealers Schedule Tests.

At its meeting last week the Automobile Dealers' Association, of San Francisco, decided to hold a hill climbing contest in or near the city on April 11th, a two days' endurance run around the bay district on May 30th, and a four days' reliability run to Los Angeles from September 6th to 9th, inclusive. Eight new members were admitted as follows: The Pope Agency, Continental Tire Agency, G & J Tire Co., Morgan & Wright, C. F. Splitdorf, Prest-O-Lite Co., Fisk Rubber Co., and the Autocar Co.

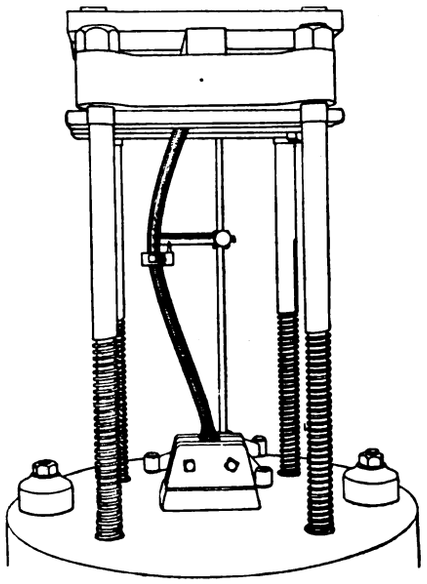
RED HICKORY PROVES ITS VALUE

Officially Tested Together with the White Variety—Important Error Found in System of Grading.

No small amount of anxiety is being felt in the ranks of carriage and wagon builders owing to the rapid depletion of the forests. In this connection recent tests carried out by the Forest Service of the United States Department of Agriculture with the co-operation of the National Wagon Manufacturers' Association of America, the Carriage Builders' National Association, and the National Hickory Association at the laboratories of Perdue University, are particularly interesting.

As a matter of fact, it was demonstrated that the present grading system involves

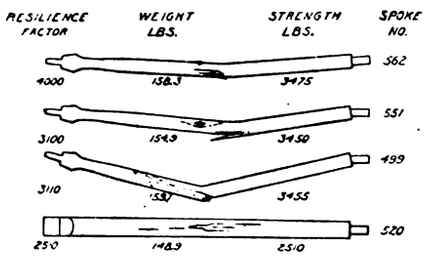


HICKORY SPOKES AFTER TEST—GRADE A

an error of more than 50 per cent., due largely to "the traditional prejudice and consequent discrimination against red hickory." Incidentally, the experiments afforded a most convincing demonstration of the value of laboratory tests in conjunction with the selection of woods for the work of vehicle construction.

The particular bearing of these trials upon the automobile industry is found in the investigations applied to the selection and trial of spokes. These trials, while applied only to spokes such as are used for light buggy construction, are particularly suggestive, as showing that the supply of available material is actually less limited than commonly is believed.

The direct object was to test the correctness of the present system of grading hickory buggy spokes and to ascertain the relative strength and toughness of red and white spokes. To this end 500 sample spokes were procured and were graded at the factory by experienced foremen, the grades being packed separately in the usual order, A-white, B-white, C-white, C-red, C-mixed, etc. The spokes were tested in the manner indicated in a general way by the accompanying figure.

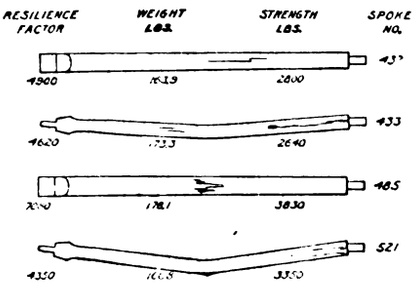


The spokes, which were of 1-inch size, were cut to 21 inches in length, were tenoned on the rim end, and the tenon was inserted in a hole in an iron block clamped to the movable head of the testing machine. The heel of the spoke fitted into a second block resting on the platform of the testing machine. With the spoke mounted in this fashion it represented a column with the rim and hub ends held in the same manner as in a wheel. The amount of bending or transverse deflection at the center was shown by a pointer attached to the

TESTING MACHINE IN MOTION

spoke, and arranged to move over a horizontal graduated scale. During the test the load at the first visible failure and the maximum load were noted, together with the corresponding deflections at the center, and in each case the test was continued until the spoke had reached a deflection of 2 inches at the center. All spokes were thus subjected to the same conditions.

The factor representing the value of a spoke should include both strength and toughness. The greatest load held up by a spoke is a measure of its strength, and the amount of bending in a spoke when the first crack occurs is a measure of its toughness. The product of these two quantities gives



SPOKES DEFECTIVE NEAR CENTER

a factor representing both strength and toughness. It is called the resilience factor. The various factors measured or computed in the tests were thus; the weight of the spoke; maximum load, that is greatest load sustained by the spoke; deflection in inches, at maximum load and at first failure, or amount of bending at the center under the maximum load and at the time of first failure; and the resilience factor, or the product of the maximum load multiplied by the deflection at first failure.

From the general results obtained, it appears that the average weight and the average resilience factors of the A-white spokes were both considerably higher than in the other grades. A wide range between the maximum and minimum value for the resilience factor in any grade is noticeable, showing that the quality of the spokes varied in each grade. For instance, it is observable that the C-red spokes have a higher resiliency than either the C-mixed or the C-white. In the same way the D-red spokes have a higher resilience factor than the D-mixed or E-white.

In the first of the accompanying figures typical fractures are shown, together with the observations pertaining to the spoke under test in each case. Only clear spokes were used in this portion of the investigation. In the two succeeding figures, are shown the results of tests upon flawed

SPOKES DEFECTIVE NEAR END

spokes, with weaknesses at the ends and near the center, respectively, and illustrating the relative importance of such flaws, when the spokes are subjected to radial load.

It should be observed that in these trials no account was taken of the tangential strain thrown upon the spokes of the automobile driving wheels, which is in some cases very high, and would naturally tend to accentuate the deflection caused by the radial load.

Of defective spokes, the official report of the foregoing tests observes that five general classifications are commonly to be found, namely: "Iron streaks, bird pecks, cross grain, knots, and wormholes. A spoke containing a wormhole is dangerous, as it is impossible to tell to what an extent the spoke has been bored on the inside. Iron streaks are supposed to be caused by the infiltration of foreign coloring matter through bird pecks. Iron streaks and bird pecks, when they show only slightly, apparently do not affect the mechanical qualities of a spoke.

"Spokes failing from crossgrain generally break in two pieces. Defects, such as knots, have greater weakening effect when near the center than when near the ends. . . . . The lower resilience factor in the spokes with defects near the center is noticeable.

"The spoke tests definitely show three

Digitized by Google

things: (1)That the present system of grading buggy spokes does not correspond to their strength and toughness; (2) that the factor denoting the strength and toughness of clear spokes varies directly with the weight, and (3) that red, white, or mixed spokes of equal weight have practically the same resilience factor."

Rapid Transit for Tennessee Towns.

That opponents to the introduction of gasolene motor cars on railroads are to be likened to the people who opposed the original introduction of the steam locomotive, was declared by the Wisconsin Railroad Rate Commission in a decision made last week in dismissing the complaint of citizens of Madison and Monroe, Wis. The complaint declared that the motor car installed in service by the Illinois Central between Madison and Freeport is dangerous and inadequate as a means of transportation.

The commission declared that this car, which is being adopted by the Union Pacific, Northwestern and other roads on branch and poorly patronized lines, is a mark of a distinct epoch in railroad transportation and will result in economy for railroads and greater benefit to the traveling public.

The commission recalls that when the English parliament was debating a charter for the first English steam railway, strenuous objections were raised and it was claimed that the smoke of the locomotive would blight vegetation, the railway would depress land values and the health of the people would be destroyed; that even hens would cease to lay eggs and that it would be better for the people to stick to the stage coaches and canal boats. The commission recalls that the health question involved in the first railway in Germany was submitted to a then eminent medical authority, who declared that not only would the travelers be stricken, but the onlookers would get a disease which he named delirium furiosum.

The result of the decision is that railway gasolene motor cars will be encouraged in Wisconsin.

Railroad Board Favors Motor Cars.

Residents of Murfreesboro and Woodbury, Tenn., are organizing a stock company which, when formed, will purchase a 30 horsepower automobile with a seating capacity of twelve, and run a rapid transit line between these cities. The car will make two trips a day, and if the venture proves profitable, additional cars will be installed.

Stage Line for Atlanta Suburbs.

The Motor Omnibus Co., with $40,000 capital, has been formed in Atlanta, Ga., for the purpose of conducting a stage line between Atlanta, Roswell, Dehlenega and Gainesville. Herbert R. Brown of Macon, and Judge S. S. Yoder, of Washington, are named in the papers.

WILL IT BE T-A-X-A- OR T-A-X-I-?

Both Forms in Use and the Question Up to Dictionary Makers—Popular Preference May Decide.

"T-a-x-a- or T-a-x-i-?"

This question has already started the makers of dictionaries, as well as the people who use this fare measuring device, thinking. One of the cab companies, the New York Transportation Co., holds to the former spelling, the other, the Taxicab Co., uses the "i."

The dictionary folk have their own opinion as to how they would have made the word if they had been called in at the start, but are not so certain what form the public will decide on, and which will receive the final authority of the printed dictionaries when the new word is inserted, as it is sure to be as soon as publishers begin to revise editions.

Dr. Charles P. G. Scott, etymological editor of the Century Magazine, when asked for his opinion as to the two forms, "taxameter" and "taximeter," said:

"While it is impossible to decide absolutely what the dictionaries will do in the matter, one thing is certain, that etymological analogy favors 'taximeter' rather than 'taxameter.' At best, both of these words are etymologically inexact. They are made up of the root of 'tax,' which comes from the Latin, and of 'meter,' which comes from the Greek. Some persons evidently consider that they are using the English noun 'tax,' or the French noun, 'taxe.' The Latin analogy of words of this kind requires 'i' as the connective vowel. If the Greek analogy were to be followed 'o' would be used, as in "thermometer,' and the business form, 'gasometer.' Those who have written the word 'taxameter' have, apparently, followed the analogy of 'hexameter, 'pentameter,' and the like; but these words are really irrelevant and the 'a' there has a different origin. Or they have assumed that the word is formed from a modern Latin noun, 'taxa,' answering to the French 'taxe' or Italian 'tassa,' from the Latin verb 'taxare,' and have, therefore, considered that the proper connective is 'a'; but, etymologically, there is no question that 'taximeter' is more correct.

"But words often get into the dictionary for other reasons than etymological exactness. One of these reasons is popular acceptance; and popular acceptance is governed by a number of accidents.

"In the case of the cab devices in question. newspapers and magazines might spell it 'taxameter,' and this spelling might be generally adopted. If it happened that the company which introduced the device in New York ran the largest number of cabs with a 'taxameter' upon them, the largest number of people would become familiar with this spelling, and it would, by rule of majority, gain precedence. In this case, although the dictionary men might not like it, they would put it down as the first spelling, and add, 'Also spelled "taximeter,"' with a note stating that this is the more correct form, etymologically.

"Then, again, the rule of priority might have to be considered. In botanical and zoological terms it is agreed that the spelling used by the first describer of the thing named shall, unless it be entirely ridiculous, be accepted in order to avoid scientific confusion and useless discussion. If the first maker of such a device spelled it with an 'a' (taxameter), this would have to be taken into consideration by the dictionary men.

"The question of legal adoption might have to be considered. If, for example, the board of aldermen should pass an ordinance in which the spelling 'taxameter' appeared, that spelling might prevail. The proceedings of aldermen always excite profound attention. The spelling in the papers of the original patent also would have an influence.

"The spelling 'taxameter' has one thing in its favor. It is stronger in sound than 'taximeter,' which has a weak stressed vowel in it.

"The pronunciation of the word also must be settled. Shall the stress be a single one, on the second syllable, or shall there be a double stress, one on the first syllable and another on the third? The conventional rule would require the single accent on the second syllable, but it is a good custom in English, in four syllable words, to use two stresses, which make the word easier to pronounce and easier to hear. Moreover, there is a tendency in compound words of this sort, where there are two elements each of which carries a distinct meaning, to separate them by stress, almost as if they were two distinct words. We speak of a kil-o-meter, rather than a kil-om-eter, although the rule requires kil-om-eter, like therm-om-eter, etc. It is possible, therefore, that tax-a-meter or tax-i-meter will become the established pronounciation rather than tax-am-eter."

At the office of the New York Transportation Co., R. W. Meade, the president, said:

"We use the spelling 'taxameter' for historical reasons largely, and because the patent papers on the device in Germany and the United States have this spelling for the Kosmos device which we employ. It, therefore, has a legal recognition and I am informed by editors of dictionaries that legal use of a word sometimes determines its acceptance, apart from questions as to its form. Moreover, this device received its first great development with German inventors who first employed a combination of 'tax' and 'meter' to designate. And the maker of the first German device spoke of it as a taxameter. We have, therefore, simply used the legal name of the mechanism we employ."

Waste Not—Want Not

There isn't any waste to Autofoid. There's much waste in cutting up leather.

The difference between buying just what you can use instead of buying irregular shaped hides, only part of which you can use, is an economical reason for buying Autofoid.

Another reason is that it's better than leather.

Autofoid is a duplication, not an imitation, of perfect leather—but it's uniform. Leather isn't.

Autofoid is the best known material for tops, cushions, etc.

The Week's Patents.

876,164. Automatic Controller for the Speed of Autovehicles. Thomas B. Ford, New York, N. Y. Filed March 28, 1906. Serial No. 308,487.

1. An automatic controller for the speed of auto vehicles comprising the motor, the traction wheels, and a shifting device having a pneumatic actuator controlled by the combined action of the motor, running at a uniform rate of speed, and the driven traction wheels running at a verying rate oi speed.

876,355. Transmission Gear. William S. Hovey, Three Rivers, Mich., assignor to Sheffield Car Company, Three Rivers, Mich. Filed April 29, 1907. Serial No. 370,848.

1. The combination of a driving shaft; a gear revolubly mounted thereon; a bevel gear secured thereto; a clutch for securing said gear to said driving shaft; a transmission shaft arranged parallel with said driving shaft; a gear revolubly mounted thereon arranged to mesh with said gear on said driving shaft; a clutch mechanism for securing said gear to said transmission shaft; connections for said clutches whereby, when one is in engagement, the other is released; driving connections for said driving and transmission shafts adapted to be connected or disconnected as desired; a driven shaft arranged transversely of said driving shaft, and driving connections to said bevel gear for the purpose specified.

876,406. Motor Vehicle. James C. Simonson, Rockford, Ill. Filed March 13, 1907. Serial No. 362,213.

1. In a motor vehicle the combination of the platform thereof, a truck supporting one end of the platform and connected thereto about midway of its length, supporting wheels connected to one end of the truck, an axle pivotally connected to the other end of the truck on a horizontal pivot, and supporting wheels connected to the pivoted axle.

876,460. Starting Mechanism for Internal Combustion Engines. Howard A. Johnston, Toronto, Ontario, Canada. Filed Feb. 11, 1907. Serial No. 356,739.

1. In an internal combustion motor the combination of a storage air tank; a second tank; a pipe connecting the two; a stop cock in said pipe; a pipe connecting the second tank with the cylinder of the engine; a pressure limiting valve in said pipe; and a stop cock between the pressure limiting valve and the second tank, substantially as described.

876,475. Emergency Brake for Motor Vehicles. Alexander D. Morgan, West Roxbury, Mass. Filed Feb. 1, 1907. Serial No. 355,226.

1. The combination with a vehicle, of an emergency brake comprising a frame pivotally attached to said vehicle, a drag pivotally attached to said frame by a substantially vertically arranged pin and maintained substantially parallel to the rear axle of said vehicle, and means under the control of the driver for lowering said frame whereby said drag is brought into contact with the roadway over which said vehicle is traveling.

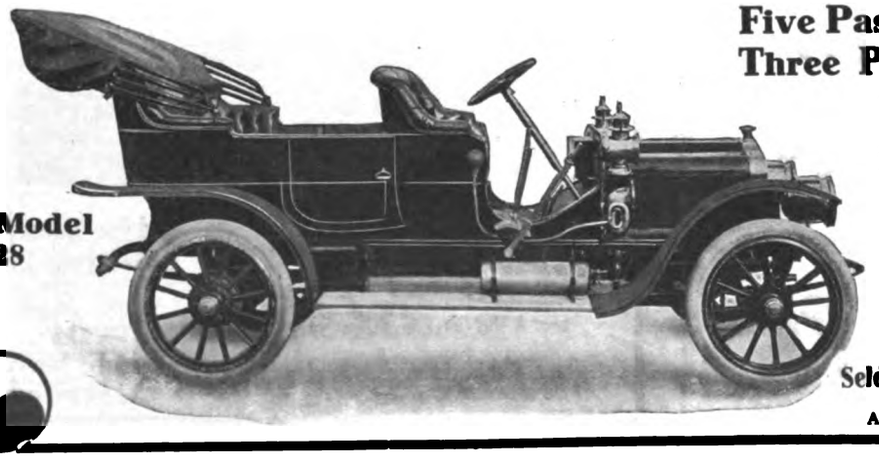
876,501. Differential Gear. Peter Steinhauer, St. Louis, Mo. Filed July 15, 1907. Serial No. 383,823.

1. A differential gear for vehicles comprising a shaft, wheels loosely mounted at the opposite ends thereof, a rotatable member encompassing the shaft between the wheels, an inner toothed gear carried by each wheel, a gear wheel secured to the shaft adjacent to each wheel, a series of pinions rotatable about their axes carried by the rotatable member adjacent to one of the wheels and meshing with the gear wheel on the shaft and with the gear on the wheel, a series of pinions rotatable about their axes carried by the rotatable member adjacent to the opposite wheel and meshing with the gear wheel, a second series of rotating pinions likewise carried by the rotatable member adjacent to said opposite wheel, said second series being disposed to one side of the first series and along radial lines concentric with the radial lines of disposition of the first series but at different distance from the common center of said radial lines, said second series meshing with the first series of pinions and with the adjacent gear wheel secured to the shaft, substantially as set forth.

876,582. Inlet Valve Mechanism for Explosion Engines. William Ottaway, Aurora, Ill., assignor to Aurora Automatic Machinery Company, Aurora, Ill., a Corporation of Illinois. Filed March 7, 1906 Serial No. 304,725.

1. In an explosive engine, the combination with the cylinder thereof provided with a valve opening and with an annular casing seat surrounding said opening, of a valve casing or shell having at its inner end an annular bearing surface fitting said casing seat, and an opening at its outer end, and clamping means embracing a clamping member which is connected with the cylinder inside of the said casing, and a nut having screw threaded engagement with said clamping member and which bears against the outer end of the said shell or casing to clamp the same against said casing seat.

876,645. Spring Cushioned Tire. Isaac Hodgson, Minneapolis, Minn., assignor to The Automatic Wheel & Rim Co., Minneapolis, Minn., a Corporation of New Jersey. Filed March 16, 1906. Serial No. 306,366.



1. The combination with a wheel rim, of armor plates applied thereto and extending circumferentially outward thereof, a yielding tension band made up of a multiplicity of pliable folds working between and having frictional engagement with the inner surfaces of both of said armor plates, radially disposed circumferentially spaced coiled springs interposed between said rim and said tension band, and tread devices applied to the exterior of said yielding tension band, substantially as described.

876,768. Extension Top or Canopy for Vehicles. Albert L. Bowen, Worcester, Mass., assignor to Charles K. Pevey, Worcester, Mass. Filed June 20, 1907. Serial No. 379,962.

1. A canopy frame for vehicles comprising a rear section and a front extensible section, each having an upright bow, a pair of short bows pivotally mounted on said upright bows and having their upper horizontal portions hinged together, and flexible connections between the short bow pivoted to the rear upright bow and said rear upright bow for the purpose specified.

876,769. Motor for Automobiles. Ralph

R. Brown, Livermore, Cal. Filed May 6, 1907. Serial No. 372,023.

1. In a device of the class described, a shaft or axle, a turbine mounted thereon and having radial blades, a casing inclosing the turbine and having oppositely disposed valve chests communicating with the interior of the casing through oppositely extending ports, a duct connecting the valve chests, slide valves mounted for reciprocation in the chests and governing the passage of steam through the ports, said valves being provided with stems extending through the ends of the chests, suitably guided flexible elements connected with the valve stems to effect movement of the valves in opposite directions, and means for supplying motive fluid to one of the valve chests.

876,800. Carburetter. Emil Gundelach, New York, N. Y., assignor of one-half to Robert J. Ehlers, New York, N. Y. Filed June 18, 1906. Serial No. 322,285.

1. A carburetter comprising a casing composed of a central, a top and a bottom section, said top section being rotatable upon the central section and provided with outlets for communicating with the working chamber of the engine, said central section being provided with a mixing chamber whose walls are spaced apart from the wall of the section, and with an oil reservoir provided with a supply pipe below the mixing chamber, and a central inlet from the bottom section to the mixing chamber, a spraying device within the inlet, said device comprising a pipe extending through the bottom section and communicating with the reservoir, the outer end of said pipe being screw threaded, a nut engaging said end for retaining the bottom section in place, and a tube within the pipe and provided with a nozzle, said nozzle co-acting with the open end of the pipe to form a contracted opening through which the liquid is sprayed, said tube having openings in the sides thereof and provided with a valve at its outer end, a float valve controlling the supply pipe of the reservoir, said bottom section being provided with an air inlet, a valve controlling the inlet, said valve having a stem projecting through the opposite side of the bottom section from the air inlet, a spring normally seating the valve, means for regulating the tension of the spring, and a fan for forcing air through the inlet.

876,826. Wheel Tire. Thomas J. McCarthy, Los Angeles, Cal. Filed Aug. 24, 1906. Serial No. 331,915.

1. The combination with a wheel and a separate tire, of radial springs pivotally anchored at both ends therebetween, and similarly anchored quasi tangential springs alternately running in opposite directions at each side of the radial springs and crossing one another longitudinally of the tire and wheel rim.

876,847. Friction Transmission Gear. George T. Stamm, Los Angeles, Cal. Filed March 18, 1907. Serial No. 363,119.

1. In a motor vehicle, in combination with the side frame members of the vehicle, intermediate friction wheels carried by the side frame members, a driving shaft, a driving friction disc carried by the driving shaft, a driven shaft, a driven friction wheel on the driven shaft, and means for moving the driving friction disc against the intermediate friction wheels and simultaneously bending the side frame members of the vehicle to move the intermediate friction wheels against the driven friction wheel.

876,878. Explosive Engine. William H. Hooper and Fred S. Hutchins, San Francisco, Cal. Filed Dec. 19, 1905. Serial No. 292,427.

1. In a gas engine, an engine frame or structure comprising a crank case, a separately formed slide valve chamber secured to the crank case, and a cylinder secured to the slide valve chamber; said three parts being in longitudinal alignment, with said valve chamber in the intermediate position.

876,905. Carriage Top. William J. Hoskyns, Detroit, Mich., assignor to The Auto Accessories Manufacturing Company, Detroit, Mich. Filed Aug. 10, 1907. Serial No. 387,966.

1. In a carriage top, in combination with a standard bow adapted to be attached to the seat of a carriage, a folding bow provided with a bent cross bar adapted to engage within the arch of the standard and support the flap of the cover when the folding bow and the standard bow are closed together, an attachment to which said folding bow may be connected at the bottom of said standard bow, and an attachment to which said bow may be connected near the spring of the arch of said standard bow, substantially as deseribed.

876,937. Power Transmitting Mechanism. Alexander T. Brown, Syracuse, N. Y., assignor to Brown-Lipe Gear Company, Syracuse, N. Y. Filed Sept. 6, 1904. Serial No. 223,371.

1. In a vehicle, a pair of axle sections, a driving gear secured to each of said sections, a shaft passing across the faces of said gears and inclining with respect to the planes thereof, pinions loosely carried on said shaft, each of said pinions having an extension with a gear, and planet gears carried by said shaft and meshing with the said extension gears, the said pinions being on opposite sides of the axle sections, and each meshing with one of the driving gears.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—No. 14 sliding gear transmissions; 90 bodies, primed only; 75 bodies, painted only; 72 bodies, painted and trimmed; 69 sets bevel drive axles and hubs; 130 frames, unassembled; 30 frames, assembled; 35 radiators; 50 tanks; 59 two-cylinder opposed engines, 5¼5; 105 sets springs; 48 mufflers; 98 sets universal joints; 47 steering wheels, 14-inch; also various quantity of other parts, all suitable for 2,000 pound touring car or runabout. RANDS MFG. CO., Detroit, Mich.

FOR SALE—$100 to $500 saved. Buy a good second hand car now for next season. Write me to see how much I can save you on others sacrifice prices. Light touring cars and roadsters, including Thomas, Pierce, Packard and Peerless, and other standard makes from $640 to $1,680. C. T. PAXTON, 1200 Niagara St., Buffalo, N. Y.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

"Keep Your Eye On Continentals"

Continental TIRES

Fastest Tires in the World!

CONTINENTALS—The Great Racing Tires—Again Victorious.

At the Ormond (Florida) Meet, event after event was captured by automobiles with Continental Tires. The great race for the Minneapolis International World's Championship Trophy was won on these tires.

The principal race of the week, for the Automobile Club of America Cup, showed Continental Tires again triumphant.

300 miles were covered in 233 minutes and 44 seconds—77 miles an hour. All world's records from 100 miles upwards broken.

In this long distance, the winning car had no tire troubles whatever, and the tires were cool at the finish.

Ormond demonstrated anew the advantages of Continental Ready-Flated equipment. This consists of tires carried already inflated on Continental Demountable Rims. In case of a puncture, a new tire can be substituted immediately for the one that is damaged.

The U. S. Army Despatch Automobile carrying a message from General Grant at New York to the Commanding Officer at Fort Leavenworth, Kansas, was equipped with Continental Tires.

This car made a phenomenal journey through snow drifts in mid-winter and distanced every other automobile racing westward at the same time.

In Europe—Jarrott has just established a new world's record for the distance by running 50 miles in 36 minutes, 5 seconds, also on Continental Tires.

The fact that Continentals are "the fastest tires in the world" is one reason why Continental Tire production is greater than that of any other concern.

Zerolene, the new carbon-proof, frost-proof, *trouble-proof* oil, does away for once and all with every uncertainty and mistake of automobile lubrication. **Zerolene** leaves practically no deposit of carbon in cylinders or on spark plugs. This oil is produced in only one place in the world.

ZEROLENE

Auto-Lubricating Oil

is the *only* oil that is suitable alike to all gasoline engines and all temperatures. It "works" freely and reliably in zero weather or in midsummer heat. **Remember, there is only one grade of Zerolene.** This one grade will give perfect service in every gasoline engine regardless of type or season. It is put up in sealed can, with patent spout that prevents **refilling.** This non-refilling feature protects you from damage by substitution of inferior oils. **Zerolene** is also put up in barrels for garage trade.

Sold by dealers everywhere.

Remember this label and the protection of the non-refilling can.

STANDARD OIL COMPANY
(Incorporated)

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

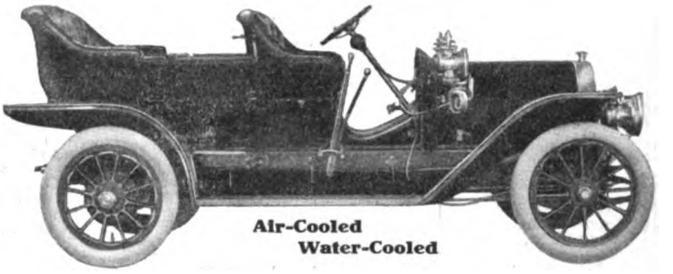
THE MARMON

"A Mechanical Masterpiece"

The Easiest Riding Car in the World



¶ No, you don't!

¶ Until you have ridden in a Marmon, you simply do not know what ease of motion in an automobile is!

¶ Until you have investigated the Marmon, you do not know how much this car has contributed to the final perfection of the automobile.

¶ Send for a catalog. Read up on the many exclusive Marmon features. Take a ride in the car itself. Test it on a bad hill, or on a particularly rough road.

¶ Then, and not till then, will you buy an automobile wisely.

Garford

We do not look for and adopt and advertise novelties. What we make is a car whose characteristics are known. Every feature of the Garford has been proved by the test of time.

It is not an experiment. In no particular or part or feature is it a trial. The Garford is already proved.

It includes nothing that is not in some other automobile. It is at the farthest remove from being a freak, a novelty or a fantastic conglomeration.

Triumph Grease, What Is It?

¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

All Roads Look Alike To The White

The White, owing to the advantages inherent in its unique system of generating and utilizing steam as a motive power, will take you anywhere at any time—it is a touring car in the fullest sense of the term. If you own a White, you need not wait until favorable weather and the County Supervisors make the roads hard and smooth, nor need you confine your touring to the main highways. All the wild and beautiful spots of nature are accessible to the driver of a White, regardless of road conditions. Buy a White and see the country as you have never seen it before and as you cannot see it in any other way.

One other point of interest, the White, because of the simplicity of its mechanism, is particularly adapted for the man who wishes to drive, and to take care of his own car.

The Wrong Way

Note Deflection at Universal Joint

The Rambler Way

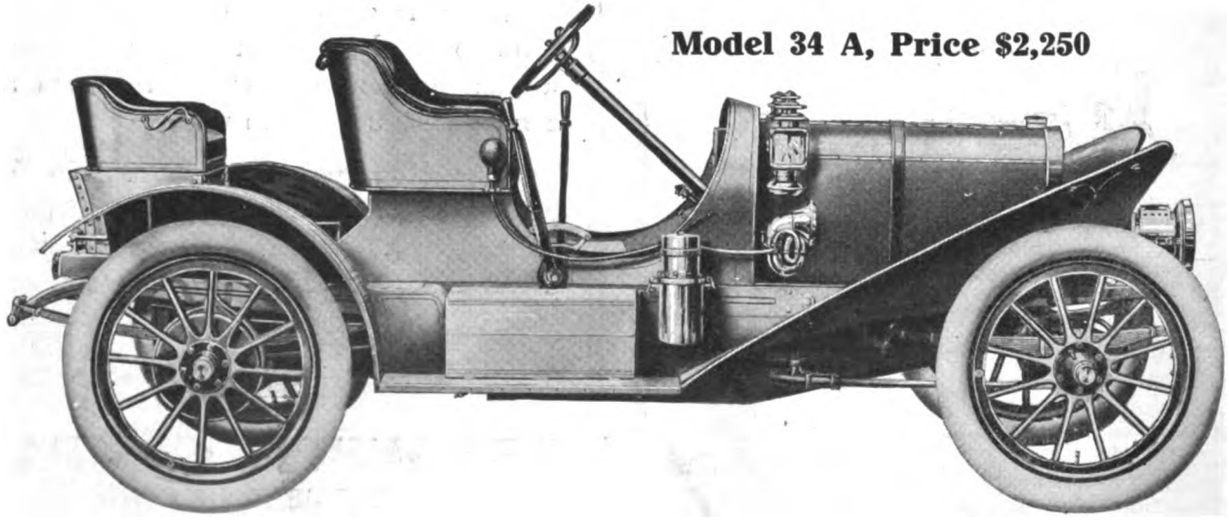
No Power Lost in Transmission

Rambler Straight Line Drive

Of the new ideas in automobile construction none are of greater value than the straight line drive system as applied to the 1908 Ramblers.

It is well known that no matter how good or carefully made the universal joint, there is an inevitable loss of power and great wear due to deviation from a straight line in the power transmitting system and the loss increases with the square of deflection.

With the Rambler straight line drive there is no deflection, hence no loss and the full power of the motor is delivered to the driving axle.



This is but one of many valuable features; our catalog tells of others of equal value; write for it today.

Thomas B. Jeffery & Company

Main Office and Factory, Kenosha, Wisconsin

Branches and Distributing Agencies:
Chicago, Milwaukee, Boston, Philadelphia, San Francisco. Representatives in all leading cities.

Model 34 A, Price $2,250

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, March 19, 1908. No. 25

POPE'S ENEMIES INVADE INDIANA

Seek to Have Him Removed as Receiver in that State—Court Confirms His Sale of Two Factories.

The men who are seeking to make trouble for Albert L. Pope, as receiver for the Pope Motor Car Co., who heretofore have confined their activities to the State of Ohio, wherein the Pope-Toledo plant is located, have carried the war into Indiana, which contains the Pope-Waverly factory. They have caused to be filed in the latter State a petition praying for the removal of Pope and of the co-receiver George A. Yule, which is similar to the petition filed in Ohio. The court has set no date for a hearing. While these proceedings, as the Motor World previously stated, include Yule, they really are aimed only at Pope. The receivers themselves are working in perfect harmony and it does not seem probable that their tenure of office will be disturbed.

Meanwhile, the United States Circuit Court in New Jersey, in which State the company is incorporated, has approved the sale by the receivers of the Pope Mfg. Co. of the Imperial plant at Chicago for $100,000, and of the Rambler plant for $125,000. When the receivers requested the order of the court confirming the sale of the Rambler factory to Thomas B. Jeffrey, of Kenosha, Wis., the National Casket Co., which previously had been negotiating for its purchase, unexpectedly raised its bid to $124,000. Mr. Jeffrey, who previously had offered $110,000 for the property, was communicated with and increased his figures to $125,000, at which figure it finally was sold to him.

Shoemaker in More Hot Water.

C. C. Shoemaker, the head and front of the much troubled Shoemaker Automobile Co., Elkhart, Ind., now has some troubles all his own, and must have cause for reflection on the difference between the chicken and the automobile industries. The property of the company was attached while it was being removed from Freeport, Ill., to Elkhart, where after its release a receiver took charge and where early this month the company was declared bankrupt. Last week, following the filing in Illinois of a petition in involuntary bankruptcy against Shoemaker personally, Thomas H. Hollister was appointed receiver. The petitioning creditors are the C. H. Fuller Advertising Agency of Chicago, whose claim is $15,000, and C. H. Cooper of Kansas City, Mo., and M. L. Feckler of Elkhart, Ind. Cooper and Feckler both allege that Shoemaker induced them to part with $5,000 each in exchange for stock in his automobile company which he agreed to take off their hands in case they repented of their bargain. Of course, their repentance became very sincere, but they still hold their stock. They allege that Shoemaker, while insolvent, transferred real estate and property to his brother and other persons, that he has concealed other assets and has absented himself from his usual place of business. Previous to his entry into the automobile trade, Shoemaker had a prosperous business in incubators, chickens and chicken supplies.

Utah Men with Wonder-Working Boiler.

The Western Motor Co., of Salt Lake City, Utah, has been incorporated under the generous law of Arizona, to manufacture a steam flash boiler which, it is stated, may be attached with equal facility to a freight or passenger car, a street car or an automobile. The officials of the company are: Edmund Wilkes, president; Milton L. Oglesby vice-president and manager; Joseph E. Aglesby, secretary and treasurer.

Settled Their Troubles Out of Court.

The litigation involving patents on tire cases or covers in which the Gilbert Mfg. Co., New Haven, Conn., and the Teel Mfg. Co., Medford, Mass., have been engaged, was last week settled out of court. By the terms of the agreement, the Teel company will discontinue the manufacture of such cases or covers.

TWO FAKERS CONVICTED OF FELONY

Their Promotion of "a Motor that Never Grew Hot" Branded Bunco—Queer Methods Exposed at Trial.

How Benson Bidwell and Charles F. Bidwell of the Bidwell Electric Co.—the concern which is said to have exploited a "cold motor" that would not stay cold, but smoked when demonstrated to a few of the thousands of stockholders who helped swell the receipts of the $2,500,000 corporation, and which motor was going to revolutionize the automobile industry, among many other things, but didn't—were able to get by the city and post office officials with their schemes was made clear before Judge Chetham in Chicago, by Miss Ida C. Palmer, an innocent looking employe. The recipe so successfully used by the exploiters, according to Miss Palmer, was this:

"Fill 'em (the examining officials) with cheap cigars, give 'em a good talk and send 'em on their way rejoicing."

The company's methods thus succinctly summarized were brought out by the questions of Assistant State's Attorney Popham at the trial of the Bidwells, which began on February 17th, and ended on Saturday, 14th inst., the jury deliberating for seven hours and bringing in a verdict of guilty on the charge of operating a confidence game, which is a penitentiary offense. The jury at first reported also a similar verdict on the charge of obtaining money by false pretences, but counsel for the defense objected to the double verdict, and the court directed that the jury find on only one count, which was done after a half hour's further deliberation, finding against both defendants, who are father and son.

Miss Palmer's testimony was elicited through the desire of the prosecution to ascertain if the company had not been investigated by the authorities. She

Digitized by Google

was the star witness for the prosecution, and told how, when one of Mayor Dunne's inspectors came around, one of the Bidwells gave him some cigars, then told him what a fine motor it was, what a legitimate business he had and how much the dividends were going to amount to. After telling the inspector this, declared Miss Palmer, Bidwell took him to the door, gave him some more cigars, patted him on the back, escorted him to the outer door, gave him another cigar and asked him to call again. When Bidwell came back, according to Miss Palmer's testimony, he said:

"That's just the way I pulled the wool over the post office inspector's eyes. Give 'em cheap cigars and talk to 'em. That's the way I get along with these fellows."

"Give 'em a good story, Ida," was a piece of advice given her, she said.

Miss Palmer said it was her duty to go through the shop, pointing out motors of the ordinary patterns and describing them as cold motors. The one operating motor was run for five minutes at a time, for to run it longer would melt the snow and ice which had "congealed" on it with the assistance of a man and a bucket. The witness further stated that she had sold considerable stock and that one time when she suggested that they needed an expert bookkeeper to straighten out the books of the company it was Charles Bidwell who said to her:

"An expert bookkeeper is just what we don't want. We have girl bookkeepers because they don't know anything. A man would find out right away what was going on."

The witness stated that the "last grand scheme" of the Bidwells was to get her to write to dissatisfied stockholders and tell them that she would buy back their stock at 25 or 35 per cent. of the original cost if they wanted to get rid of it. She received mail in this connection addressed to "Victoria C. Freeman, general delivery." The idea she said, was to sell this stock over again to new buyers at 75 per cent. on the hundred. She also stated that the Bidwells had promised her $2,000, but that she only received $130 in instalments, which may explain her willingness to aid in the prosecution of the promoters.

Charles J. Moberg, who said that he worked for the Bidwells 449 days, was another witness called.

"Charles Bidwell sometimes brought people in after the motor was frosted," said Moberg. "Then he would say, 'Give us light,' and I would turn on 250 electric lights that were run by the motor. These were kept going five or ten minutes, but only when people were in there to see it. I never saw it working any other machine or supplying power."

O. C. Wilson, an advertising agent, said he placed $85,000 worth of advertising in papers, which the Bidwells authorized and paid out of the funds of the company.

The Week's Incorporations.

Manistee, Mich.—American Garage and Motor Co., under Michigan laws, with $5,000 capital. Corporators not named.

St. Louis, Mo.—Spring Motor Fan Co., under Missouri laws, with $50,000 capital. Corporators—Herman O. Engelke, Edgar E. Engelke and Edward H. Rose.

Paterson, N. J.—Taximeter Auto Co., under New Jersey laws, with $125,000 capital; to manufacture motors, engines, cars, boats, etc. Corporators—W. F. Harding, Haledon, N. J.; A. A. Fischer, J. F. Blauvelt, Paterson, N. J.

New York City, N. Y.—Harvard Automobile and Garage Co., under New York laws, with $10,000 capital. Corporators—Alois Habisreitinger, 1696 Week avenue; Benjamin B. Dolero, 110 West Ninety-fifth street, New York City, N. Y.

New York City, N. Y.—Progress Motor Vehicle Co., under New York laws, with $50,000 capital; to deal in, maintain and operate motor vehicles, etc. Corporators—F. J. Hogan, M. Schlesinger, L. Divizic, New York City, N. Y.

New York City, N. Y.—Union Taxicab Auto Service Co., under New York laws, with $150,000 capital; to manufacture, deal in and hire out automobiles, etc. Corporators—W. J. Duane, F. A. Phillips, C. C. Bailey, New York City, N. Y.

New York City, N. Y.—Knickerbocker Taximeter Cab Company, under New York laws, with $15,000 capital. Corporators—William B. Hurlburt and Sanford J. Wise, 1540 Broadway, and Stewart H. Eliott, 1183 Broadway, New York City, N. Y.

New York City, N. Y.—S. & S. Variable Speed Gear Co., under New York laws, with $20,000 capital. Corporators—Bartlett G. Yung, 34 Gramercy Park; C. D. Francis, 60 Wall street, New York City, N. Y.; Bernard E. Scriven, 1203 Eighth avenue, Brooklyn, N. Y.

San Francisco, Cal.—Taxicab Co., The, under California laws, with $500,000 capital; to operate taxicabs. Corporators—J. W. Reese, Gilbert D. Boast, Joseph D. Kennedy, Clarence E. Sheets, James Moriarty, Charles McDonough and Nathan M. Moran.

Kittery, Me.—Simplex Motor Car Co., under Maine laws, with $50,000 capital stock, of which nothing is paid in, to manufacture, deal in and repair automobiles and motors. Corporators—O. Sumner Paul, president, and Albert H. Peavey, treasurer, Kittery, Me.

New York City, N. Y.—Requa-Coles Co., under New York laws, with $100,000 capital, to deal in automobile devices. Corporators—Leonard F. Requa, 267 West Seventy-ninth street, New York City; David H. Coles, 11 McDonough street, Brooklyn, N. Y.; Philip Van Alstine, Spring Valley, Rockland county, N. Y.

In the Retail World.

The Maxwell-Briscoe Automobile Co., has taken possession of its new garage at 1616-18 Grand avenue, Kansas City, Mo.; its proportions are 50 by 100 feet.

George F. Dyer has sold his automobile business at Manchester, Mass., and will remove to the South. Ill health in his family is his reason for relinquishing the business.

Wyatt & Listner is the style of a new firm which has commenced business at 1773 Broadway, New York. They have the agency for the Empire State Tire Co., of Buffalo.

S. L. Hoagland of Almond, Wis., has moved his garage equipment to Waupaca, in the same State. He has rented the first floor of the Peterson building for garage purposes.

The Seattle (Wash.) Automobile Co. has filed the necessary legal notice of its intention to increase its capital stock to $100,000. A meeting of the stockholders will be held for the purpose on April 27th.

Manitowoc, Wis., has been for some time in need of a garage and now is to have one of an up to date character. It will be opened by Hall Bros., of that city, who have secured agencies for half a dozen leading automobiles and will cover the city and surrounding territory.

The Jordan Automobile Co., Minneapolis, Minn., which went into the hands of a receiver in November last, resumed business last week at its old stand, 217 Fourth street, with the Franklin agency as its exclusive account. It is stated that the company paid every creditor in full.

Rockford, Ill., is to have a new garage at 122 North First street, where Fred Miller purposes erecting a two-story brick building, 140 by 120 feet in dimensions. Troller & Co., a corporation formed by Ed Troller and Miller, will occupy the first floor as a garage, where they will handle Oldsmobiles and Wintons, Goodrich tires and a full line of accessories. They are located now in South Water street.

MIXING POETRY AND MOTOR CARS

Kansas City Genius Shows How It Can be Done—His Rainbow Hued Inducements to Customers.

There are two Kansas Cities, but only one Allen Dorman, who lives within the confines of one of them—the one located in Missouri. He is the "owner and manager" of the "K. C. Auto Brokerage Co.," and is "Kansas City's Automobile Leader"—his letter head says so. But according to this same bit of stationery he does more than lead with such prosaic things as automobiles, for there is evidence that he is able to mix poetry and brokerage in large doses. The letter head, which, incidentally, bears in one corner a portrait of Allen Dorman, as he is to-day, and in the other corner a picture of the same but much leaner Dorman, as he looked 20 years ago, proclaims also that he is the "author of Allen Dorman's poems; 524 pages; silk finish; illustrated"; a few of them are enumerated, among them. "Diamonds Among the Lillies," and "Satan with his Tail Screwed to a Bench."

The letter head also makes known that Dorman is "promoting the Kansas City Electric Plow Co., capital stock $1,000,000." He has issued a circular letter addressed "To My Customers," which shows how an inspired genius "does things" when he engages in the automobile business, and is not occupied with the task of poetically screwing Satan's tail to a bench. The letter is worth a niche in the hall of fame. Read it:

"To my Customers:

"Many thanks for my write-ups, most all over the United States, from Maine to California. I wish to show gratitude for my write-ups in the sale of automobiles whenever I can. Science is on the move. Civilization saw the wild horse of the plains harnessed to till the soil. The wind mill and storage battery may draw on the mad force of the storm to run your auto or plow the land. The tempest may be harnessed to man's use. Do not purchase an auto that soon may become obsolete. Purchase of me; I will fix you right. I am in a position to deal direct with the manufacturer. I also do a general agency business. An up town office for any dealer or manufacturer. I can sell you a fine outo cheap. I know of bargains for somebody. Please call and consult me before you purchase. State the kind and size you wish. I wish to secure 1,000 names and addresses of those who wish to purchase autos in 30, 60 and 90 days, so I can arrange to order a car load each week. You pay half down when I order, less 30 days club rates. The good work has already started. Send me your name and address, plainly written. Freight from $9 to $99 per auto. Two or more autos are a car load. Second hand machines sold or exchanged. City trade earnestly solicited. Editors when in the city should ask my friends for a ride. Please send names. State your nearest railroad station. Goods shipped direct from factory. State what you wish. Do your people need rain?"

The poetic genius of Dorman is reflected in his correspondence. In one of his letters addressed, not to an individual, but to a big automobile company, requesting a catalogue, signed "Your friend," and marked "Personal," he says: "I secured orders for $25,000 of autos last Tuesday when I was so tired I could not lay on the bed."

First Show in the South.

Every automobile dealer in Memphis, Tenn., attended a meeting of the Automobile Dealers' Association of that city last week, at which it was decided to hold an automobile show in the Auditorium on April 16, 17, and 18. There was much enthusiasm over the project, which, according to President Jerome P. Parker, will be the first automobile show given in any of the southern States. The dealers say they will spare no expense to make the affair a success, and the work of preparation has been placed in the hands of competent committees.

American Locomotive Making Taxicabs.

The American Locomotive Co. has entered the taxicab field, through its subsidiary automobile company, an initial contract for 100 taxicabs being now in course of production at the plant of the American Locomotive Automobile Co. at Providence, R. I. The order was placed by the William H. Scaich Co., which has the contracts for the cab privileges at the Waldorf-Astoria, the Holland House and the Park Avenue Hotel, in New York.

Trade Association Formed in Michigan.

As a result of the promotion of the trade carnival which begins in Indianapolis on Monday next, the Indianapolis Automobile Trade Association has been formed and will be incorporated. Frank Staley, R. I. Eads and C. S. Hicks were named as a committee to attend to the preliminaries.

Borsch Adopts Explanatory Name.

Robert Bosch, New York, Inc., has changed its title to the more euphonious and explanatory Bosch Magneto Co. The change is of name only; the officials, product and location, 160 West Fifty-sixth street, New York, remain exactly as heretofore.

Toledo Parts Company Fails.

The Toledo Auto Parts Co., Toledo, Ohio, is in the hands of a receiver. Action to that end was taken by Frank J. Cheney, who owns the building occupied by the concern. He alleged that it is insolvent and unable to pay $700 due under the lease.

INTERCHANGEABILITY STANDS TEST

American Cars Dismantled and Reconstructed from Promiscuous Lots of Parts—English Test a Practical Dem

American manufacturing methods, on trial at the hands of the British public and an official committee of the Royal Automobile Club, have won an overwhelming victory in the performance of the three 10 horsepower, Model K, Cadillac cars which have just completed the "standardization test," which has set all England by the ears. Selected by ballot, tried out officially, and then dissected and intermingled in one confused mass, the parts were again assembled, the three "new" cars adjusted to running order, and by way of final demonstration of their running capabilities, were run through a 500 mile endurance run on the Brooklands motordrome. The performance was carried out at the instance of the Anglo-American Motor Co., of London, British agents for the Cadillac product.

The preliminaries to the test took place on February 29, when representatives of the Royal Automobile Club met at the show rooms of the Cadillac agency and selected the three cars out of a group of eight. Characteristic of the thoroughness with which the entire test was carried through, was the method of choice. Four cars were first picked off-hand, and the three were afterward selected from these by ballot. A run out to the Brooklands course, followed by a 25 mile running test on the track followed. In this, one car was so unfortunate as to reverse a spring shackle when crossing a bump in the course, and the occurrence was recorded as an error against it, though admittedly not a serious one.

The complete dismantling of the cars occupied two whole days, only two men being alowed to take pare in the work, and then only under official supervision. The dismantling was carried out to the extent of stripping the chassis down to the dashboards, coils and pedals. During the remainder of the week the parts accumulated from the cars were mixed and reassorted into heaps, from which the rebuilt cars were to be assembled. The final endurance test was planned to occur on Monday, 9th inst. One of the cars was finished in time to participate in the program as arranged. The other two were delayed, their parts being frozen fast in the floor of the barn where they had been stored, owing to an unforeseen rain and sleet storm, which combined to ice up the course and delay the work of car manufacture.

Later, the parts of the remaining cars were thawed out and put into place and the trials completed as planned. According to cable despatches, the three cars ran "wheel to wheel" for the entire distance, covering 500 miles at the rate of 34 miles an hour.

STUDEBAKER ARMY CAR REACHES FORT

Machine Driven From New York by Drivers Huge and Smith Arrives at Leavenworth After Eighteen Days of Travel.

According to telegraphic advices, the thirty horse-power Studebaker car, which made the run from New York, arrived at Fort Leavenworth at 11:32 yesterday morning after having been on the way eighteen days two hours and thirty-two minutes.

Colonel Loughborough accepted the message from General Frederick Dent Grant, after which the tourists were welcomed by General Hall. The car covered the last ten miles in twelve minutes. The car was escorted to Leavenworth by the local automobile club members.

Mayor Peter Everhardy of Leavenworth extended the key of the city to Drivers Huge and Smith at a banquet held last evening. The car left for Kansas City at midnight.

The machine left New York on Tuesday, Feb. 18, and completed one of the most remarkable trips ever accomplished by an automobile. It would have been a hard trip for any car, even under the most favorable conditions, but starting, as it did, on the heels of the worst snowstorm which has visited the central states in the past twenty years, it is marvelous that the distance, nearly 2,000 miles, should be negotiated in a period of only a little over two weeks.

Starting from New York six days after the New York to Paris racers had begun their trip westward, and that after only a few hours' preparation, the little car, following the same route as the transcontinental racers, moved with such regularity upon its way that by the time it reached Chicago it had overhauled and passed every one of the New York to Paris contestants.

It is true that the car was driven night and day by relays of drivers, but the real secret of the splendid time made by the car was due to the fact that practically no time was lost making adjustments or repairs. It was always ready to push on when the driver was ready to take the wheel. Much time of course, was lost upon the fearful roads in northern Indiana. Hours were spent digging through single snowdrifts, and when the aid of horses was finally secured all the power the sturdy little car possessed was utilized to flounder through the snow.

It really does not seem credible that any piece of machinery could be so perfectly constructed as to successfully endure the work the little Studebaker engine was called upon to undergo throughout this trying journey.

When the car reached Chicago, instead of remaining here for several days to be overhauled, as did the New York to Paris contestants, it again started upon its way after only a few hours' delay. It was after dark Tuesday evening before General Grant's message was presented to Brigadier General Carter, commanding the Department of the Lakes, and before daylight the following morning it was on its way to Fort Leavenworth, Kan., via Omaha, Neb., having found it necessary to abandon the shorter route on account of the roads being practically impassable.

From the time of leaving New York until the car reached Leavenworth, the trip was one continuous ovation for the sturdy Studebaker car and its plucky drivers. The drivers and car had many narrow and thrilling escapes on the way. Ner Utica, N. Y., the car and drivers were pitched into the Erie canal, and several times before reaching Chicago the drivers, unable to distinguish the roadbed, ran into a ditch. Out in Iowa Smith had to ditch the car in order to avoid a collision with a runaway horse, and later on ran into a wire fence across the road, which was hidden in a snowdrift. This was the same driver, Milton Smith, who drove from Kendallville, Ind., to Michigan City, staying at the wheel for over forty hours, and then with only an hour's rest, being the only man familiar with the road, climbed on the machine again and rode into Chicago beside the new driver, Jack Huge, making nine hours more on the car, or nearly fifty hours in all.

As one reviews the incidents and hardships of this trip, one cannot but arrive at the conclusion that it was the most severe trial of endurence ever performed by any car, and it should fully demonstrate to the War Department the availability of such a car as the Studebaker for the purpose of carrying army dispatches in time of war

NEW YORK, MARCH 19, 1908

Unworthy Action of the A. C. A.

Not many unbiased men will waste much sympathy on or lend much support to the Automobile Club of America in its withdrawal from the American Automobile Association. It is big enough and strong enough, and should be broad enough to be above petty contention and personal grievance. Not one statement that has issued from the little coterie responsible for its action, since the present situation was precipitated, has served to make the club's position the more admirable. Its manner of "wishing the A. A. A. every success," while apparently being the retort courteous was made snakelike by the enclosure that accompanied the "wishes"—an enclosure reciting the withdrawal of another club in an entirely different State and with which the A. C. A. had nothing to do. The coterie's efforts to make it appear that the legislative interests of New York City are separate and apart from those of the rest of the State likewise smacks of insincerity and are farfetched and without merit.

The Motor World scarcely can believe that the action of the directors of the A. C. A., however binding on the organization as a whole, represents the sentiment of the general membership; therefore we refer to "the coterie," which probably is more nearly correct. The action of the club is similar to the action of the small boy who is mad and "won't play, so there now!" It is plain to any one with half an eye that some large man's dignity has been offended, or that his self-conscious worth has been suffered to pass without proper appreciation and that he is "getting even" for the slight.

What the club will gain by holding aloof and flocking by itself and refusing to cooperate, is beyond understanding. It certainly is not a national organization and never can be recognized as such; and it is very many years since it was the "whole thing." It as certainly cannot attempt legislative effort without coming into conflict with the rest of the State and thereby causing chaos and defeating the best interests of automobiling; and as the State law governs the city ordinances, how it can serve even local interests is problematical. The fact of the matter is that the A. C. A. is in no enviable position and is hard pressed for logical explanations or excuses. Its action is unworthy of it; it is a smudge on an otherwise honorable record and each attempted explanation serves to make the smudge worse. Only one defense is possible—that the club needs the money expended for dues; and the club itself has cut away that prop. In the matter of official representation, the A. A. A. always has recognized the club handsomely, and if it were not for the fact that several New York automobile writers are possessed of jealousy or personal grievances of their own—apparently chiefly because one or two of their craft have office or influence in the A. A. A.—it is doubtful if one pen would write even a labored brief for the Automobile Club of America.

The situation, however, adds force to what the Motor World persistently has pointed out to the A. A. A., i. e., that club membership is closely akin to the house built on shifting sand. As in the present case, the withdrawal of any club may be brought about by any strong member with a grievance, or by the very human conclusion, reached sooner or later, that it were better to save large lump sums paid out of a club's treasury. The Buffalo club, now the bulwark of the New York State Association, is just as likely to be ultimately so affected as any other unit of the A. A. A.. Each withdrawal works mischief and spreads far reaching misconception. Many people reach their conclusions from big headlines and when the latter announce "War" or "Disruption," as in the present instance, that is the idea that will most generally prevail. Individual membership is the most lasting foundation. The A. A. A. should be wise in time and be not misled because of present prosperity and because "members in blocks" come easiest.

The Motor and the Buggy.

Because the high wheeled motor buggy is even yet regarded in many quarters a sort of unsophisticated cross between a wagon and a motor car, the fact is not generally appreciated that it presents certain problems of design which are as novel, as they are distinct from those which have influenced the development of the purer type of car. Such is the case, however, and among the builders and owners of these useful vehicles sharp discussions are arising as to the respective merits of this or that system, which are distinctly reminiscent of the early days of the automobile itself—and some of the later days as well.

One of the questions which already is arising for argument, and which promises to be the turning point of heated controversy in the future, relates to the old question of engine position. Primarily, the motor buggy being, in a sense, an assemblage only, of motor, transmission and carriage, the "works" were most conveniently located underneath the body, or within it, according to circumstances. The traditional position is thus the same as with the automobile proper. A newer school, following the reasoning which led to the adoption of the forward position for the engine in that case, has also employed a front mounted engine for the motor buggy. In this connection some of the most advanced and perfect mechanism yet applied to this purpose has been utilized. The respective merits of the two systems would appear to be the same as with the heavier and lower wheeled automobile. The students of the matter hold that such is not the case.

The arguments advanced in favor of the rear mounting of the power plant as against the front, are two-fold. It is claimed, first, that with the forward position of the en-

Digitized by Google

gine, the vehicle is inclined to skid unpleasantly because of the concentration of so much dead weight in front, and that even when running on a perfectly straight course, there are times when it tends to "wag its tail," metaphorically speaking, and to an unpleasant degree. Second, it is claimed that because of the great diameter of the driving wheels and the low resiliency of the solid tires, the wheels tend to bound and skip over uneven surfaces, thereby cutting down the traction and rendering the propulsive effort less continuous than when greater adhesion is secured by placing the motor further to the rear. It is admitted, however, that neither of these tendencies is manifest at speeds below fifteen miles an hour.

On the other hand, the advocates of the front mounting for the power plant claim better guidance with more even distribution of weight, a more satisfactory and economical disposition of the organs of transmission, an easier riding vehicle, and altogether a more convenient one in point of luggage capacity and accessibility of mechanism. As yet too little is known of the properties of this type of vehicle to warrant the outsider in taking up a definite position on either side. But it is enlightening to note that such a conflict of opinion exists where none had been suspected. The outcome will be watched with interest.

Federal Aid for Road Improvement.

To the man unversed in constitutional law, it always has seemed that if it were legal to build national highways in the time of our forefathers, it still is legal to do so; it always has seemed that if it is constitutional for Congress to expend money for for the improvement of rivers and harbors, it is legal for it to expend money for the improvement of the common roads.

If the greatest good for the greatest number is one of the aims of government, there is no room for doubt that as between the river and the road, tens of thousands will be served by the road while individuals are served by the river. If the river promotes commerce, the road promotes both commerce and the individual prosperity and personal well being of each citizen. It would seem therefore that Federal aid cannot serve more persons or purposes, or better ones, than by application to the improvement of the roads. It is aid of the sort to which even the most ardent State's rights advocate hardly will object. If it is not constitutional, it should be made constitutional.

These thoughts are suggested by the bill which the National Grange has caused to be introduced into Congress. It would have the Federal Government appropriate $50,000,000 for road improvement. As apportioned over a term of years, the amount is pitifully insufficient, but accepted as an entering wedge and as marking a beginning, it is a big stride in the right direction. The bill should be pressed home. Every organization should place its strength behind it. Led by the Grange, the cry of "special interest" scarcely is likely to be raised. Every effort brought to bear will be, therefore, more likely to achieve result. Men elected to public office appear to have a peculiar regard for the farmer vote and they are therefore likely to give more heed to the Grange's bill, than otherwise would be the case.

The Rising Against Frelinghuysenism.

It took the New Jersey worm a long time to turn, but it appears now to have turned in no uncertain fashion. The fight which is being waged against Frelinghuysenism is positively inspiring. That possibly astute politician apparently considers automobilists "good things" fit only for "plucking" and it is high time that he was shown the error of his estimate. The Newark trade association is pointed in the right direction in seeking to pledge their legislative representatives against Frelinghuysenism, and all it stands for. The average politician is fearful chiefly of organized effort and when organized effort seeks the defeat of a candidate at the polls, it is then that it becomes mighty. The automobilists may not be able to change the result of a State or a city, but they must hold the balance of power in more than one ward or precinct, and that power should be brought to bear.

Let Well Enough Alone!

Why in thunder do not the New York State Automobile Association, the Automobile Club of America, and Albert Shattuck let well enough alone? The New York law has stood the test and stood it well. It requires no tinkering of any sort.

Why should any man or any organization agree to an increase of fees, even for road improvement? It is wrong in theory and wrong in practice. It is special legislation; it is the sort of legislation the organizations should oppose as a matter of right and of principle; and if it means fight, the fight may as well begin in the Empire State. New York State already has voted $50,000,000 for road construction; the automobilists will bear their share of the taxation. It is not fair that they should bear more than their share. It is not proper that their chosen or self-chosen leaders should consent to do so.

If fifty millions are not enough for the work, let more millions be obtained. But let the burden be distributed equitably, which is to say, legally. The cry that automobiles injure the roads is little more than an echo of the cry that bicycles injured the roads, which cry soon was dissipated in thin air. No cycling organization and no politician would dared have advocated a special tax on bicycles, when the cry spent itself. If there are automobilists who desire to contribute to betterment of the roads, it is their privilege to do so. It is not right that contribution in the guise of special taxation be wrung from them by process of doubtful law. It is mischievous process.

COMING EVENTS

March 15-April 1, Omaha, Neb.—Omaha Automobile Dealers' Association's annual show in the Auditorium.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

March 18-24, New Haven, Conn.—New Haven Automobile Dealers' Association's show in Music Hall.

March 18-25, Rochester, N. Y.—Rochester Automobile Club's show in new Convention hall.

March 23-28, Indianapolis, Ind.—Indianapolis Automobile Dealers' Association's show week.

March 31-April 4, Salt Lake City, Utah—Automobile show in Auditorium skating rink.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

April 6, 7 and 8, Denver, Col.—Annual show in Mammoth skating rink.

April 6-11, New York City—New York Automobile Trade Association's carnival week.

April 16-18, Memphis, Tenn.—Automobile show promoted by the Automobile Dealers' Association of Memphis, in the Auditorium.

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

May 5-6, Harrisburg, Pa.—Motor Club of Harrisburg's second annual endurance run.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

A. C. A. GETS MAD AND WONT PAY

Withdraws from A. A. A. and Will Flock by Itself—"Too Much Shattuck" the Basis of the Trouble.

The A. A. A. and the A. C. A. are "out." It has been no secret that there long has been friction between the two bodies—the American Automobile Association and the Automobile Club of America—and as only two weeks since it was stated publicly that the big club would break away from the national organization by failing to renew its membership when the year elapsed, official announcement of the fact, which was made late last week, caused no general surprise.

The announcement followed the annual meeting of the New York State Automobile Association at Buffalo on Thursday, at which Oliver A. Quale, of Albany, and Chauncey D. Hakes, of the same place, were re-elected president and secretary, respectively. President Hotchkiss, of the A. A. A., came to New York immediately after the meeting and issued this statement:

"While the differences between New York's local club and the State association proper, which is a body of forty clubs, including one at Buffalo as large as the local club here, have been brought to a head by the contemplated action of the State body, requiring the New York club to pay dues on a per capita basis of its full membership, the breach dates well back and was originally opened by conflict over matters of State policy in legislation.

"It is perhaps proper for me, as president of the American Automobile Association, to say that I do not regret the resignation, but welcome it. It is high time that motorists understand whether a mere name adopted in the infancy of the motor vehicle in this country, and which has since become a misnomer, entitles any local body in any city, no matter how great, to lord it over hundreds of other clubs in other parts of the country. Indeed, the time has now come to determine whether the American Automobile Association represents those motorists or whether they are to be represented by a small clique of gentlemen who manage a local social club. I, therefore, hail the issue and have no doubt of the result."

Early this week, the Automobile Club of America made official answer to Mr. Hotchkiss in this language:

"The board of governors of the Automobile Club of America were surprised to read in the public press the statement attaributed to President Hotchkiss of the American Automobile Association, that he 'welcomes the withdrawal of the Automobile Club of America' from the organization of which he is president, and 'hails the issue.' This statement, coming from a man of President Hotchkiss's judicial attainments, is the more surprising, because the Automobile Club of America is not aware that any 'issue' exists. The club withdraws from the affiliation with the American Automobile Association for the purpose of more effectively carrying on its numerous activities, not only for the benefit of its own members in all parts of the country, but also for motorists generally. The question of 'raising the dues' was not known to the board when it decided to withdraw, and so had no bearing on the decision.

"The Automobile Club of America, the first club formed in America and immediately constituted the sole recognized American representative of all the foreign Automobile clubs, which it still is, fought and won the early battles for motorists in this country, and needs no apology for its name. To these early struggles the American motorist is largely indebted for the rights which he now enjoys on the public highway, in the parks and on the ferries.

"The Automobile Club of America has always believed in fostering inter-club relationship by interchange of club privileges. It wishes the American Automobile Association every success in all its endeavors that make for the good of the sport of motoring, and will at all times be glad to render such assistance to this end as may be within its power."

Accompanying this official answer, which was sent to the press, was a short notice reciting that the Massachusetts Automobile Club had refused to reconsider its resignation from the A. A. A.. It is presumed that the Automobile Club of America included the item regarding the Massachusetts club as evidence of the good faith contained in its statement that it wished the A. A. A. "every success!"

While the item of dues has been permitted to cut a large figure in the rumpus, it is really of minor importance. It appears that until last week's meeting the annual dues of the New York State Automobile Association were at the rate of $1 per year, except that when a club attained a membership in excess of 500 members, no dues were paid upon such excess membership. Two clubs, the Automobile Club of Buffalo and the A. C. A., were the only ones to profit by the excess membership clause, and recognizing its unfairness and inconsistency the Buffalo club proposed the amendment making the dues $1 per member regardless of a club's strength. This change in the constitution cost that club $720 additional and had it remained within the association, the A. C. A. would have had to pay a total of $1,237 instead of but $500 as before. There were those who hung the withdrawal of the A. C. A. on this peg, but as a matter of fact the dues had little, if anything, to do with the matter. Although New York, both city and State long have enjoyed a great preponderance of representation on the A. A. A. official slate and on its committees, many of whom were drawn from the A. C. A., there are those in the club who apparently cannot reconcile themselves to the fact that it is not the "whole thing" or who cannot bow gracefully to the will of the majority, and this is the real basis of all the trouble. Chief of this coterie is Albert R. Shattuck, the first president of the A. C. A. and who ever since has been the man behind its scenes. His influence pervades the entire organization. Two years ago the club wanted to tinker with the State law. They had a rather drastic bill ready for introduction, but the State association very properly blocked it, and has continued to block it, which did not contribute to the good feeling. This year the State association prepared a new bill and had its machinery well oiled, when Shattuck turned up at Albany with diverging views and ideas of exorbitant fees, and upset all arrangements and made it appear that there was lack of harmony among the automobilists themselves. Quite naturally the association resented Shattuck's action and the A. C. A.'s withdrawal followed.

Not every one in the Automobile Club of America sympathizes with its action, and not a few members will continue their allegiance to the A. A. A. in their individual capacities. Among them are Jefferson Du Mont Thompson, chairman of the A. A. A. racing board and W. K. Vanderbilt, Jr., who also is a member of the board.

When Secretary Butler of the Automobile Club of America was asked to supplement the statement that had been given out over his signature, he responded that there was nothing more to be said.

"Do you consider the A. C. A. in the light of a national organization?" inquired the Motor World man.

"Only insofar as we will continue doing all in our power for automobilists everywhere, as we always have done," was the response.

"Do you intend to build up a national organization?"

"That subject has not been taken up. For the present nothing to that end will be undertaken. What may happen later I don't know. But if such a step were contemplated I do not think it would be wise to discuss it until the plans were formulated; the future will take care of itself."

"But should you determine on such a proceeding," persisted the interviewer, "would you not be handicapped by the section of your constitution limiting your membership to 2,000?"

"That is easily overcome. A vote would alter it."

"Do you think that the best interests of the automobilists would be served by two organization?" he was asked.

"I am not prepared to answer. If many clubs should leave the A. A. A. there might be need of an organization of wide scope."

"Your statement, issued yesterday, says that you have withdrawn from the A. A. A. for the purpose of carrying on more effectually your numerous activities. What do you mean by that?"

Digitized by Google

"Well, take the subject of legislation. We had only two members on the A. A. A. legislative committee, and they found it to be impossible to convince the members from up the State that conditions in this part of it, say within a hundred miles of New York City, were different from those further north. Rochester, Syracuse, Buffalo, etc., had no experience with police traps and were desirous of standing pat on existing laws when we needed new legislation for our own preservation or protection, if you want to call it that. As free agents we will be better able to represent the metropolitan automobilists and actually our first duty is to them."

"Besides legislative activity, what else?"

"We will continue our road signs work and keep up our tour bureau, of course."

"Should you eventually decide to become a national body, would you organize something new or affiliate with some body now in existence?

"I can't say, because I don't know. That would have to be a question for the future to settle."

"Did the question of the increased dues have anything to do with your withdrawal?"

"Not in the least. Personally, however, I think that putting the same money into road signs will be of more benefit to motorists than paying it into the organization for dues. But I want to add this," continued the secretary, as the interviewer prepared to leave. "This club bears no animosity in any way to the A. A. A. We hope they will succeed, and we will do anything we can to aid them in any and all efforts for the good of automobilists. Our withdrawal is for our own good only and is not to be construed as a move against the organization in any way."

As Secretary Elliott of the A. A. A. was in Savannah, and no one in his office was authorized to discuss the subject, nothing additional could be obtained from that source.

When the subject was broached to a man who stands on middle ground and who is so placed that he is able to be unusually well informed, and who is unbiased, he did not hesitate to express his opinion.

"It is simply a case of too much Shattuck," he said in a tone in which there was a note akin to disgust. "Shattuck deserves a lot of credit. He is a hard worker and a mighty able one, but he has a personality that is a liability rather than an asset. As its president and since, he did much to make the A. C. A. what it is to-day, and though he may mean all right, it's hard for any one to be convinced of his good intentions. The A. C. A. is unpopular in many directions, and all because Shattuck's personality has permeated everything. The club house is a 'morgue,' and so full of flunkeyism that few men go there more than once if they can help it. There is about Shattuck a defined paternalism that doesn't appeal to Americans, and other clubs resent this same paternal attitude that the A. C. A. assumes. Quale and Hotchkiss, of the A. A. A., convinced the legislative body that the sliding fees from $3 to $15 was all the motorists could stand or would stand, but up bobs Shattuck, who says that $4 to $40 would be about right. As a result, some angry legislators and some angrier A. A. A. representatives. And Shattuck is the man who says foreigners are better than Americans. And there you have it! Why even the A. C. A. is tired of him and sooner rather than later, I think you will find that he and Dr. Skaats Wheeler, who helps him 'run' the club, will find their stools moved into a back row. Then you'll see more trouble and lots of it. There will be no new club, as has been prophesied, but a revolution in the old club itself."

At this point it was suggested that Secretary Butler's position could not be likened to a bed of roses.

"I should say not," came the quick response. "I wouldn't take Sam Butler's berth for $500 a week payable in advance—and incidentally," he added, "I'd want at least that sum for standing for Shattuck and his foreign airs and domineering ways, to say nothing of a few other individuals and incidents that are part and parcel of the job of secretary of the A. C. A."

To those who do not know Mr. Shattuck, it will be illuminating to say that in signing hotel registers, it was his custom to inscribe himself: "A. R. Shattuck and servant." The "servant" was the human being who acted as his chauffeur.

Big Penalties in Milwaukee Contest.

Held at a time of the year when road conditions are worst, it is not surprising that the three days' reliability contest promoted by the Milwaukee Automobile Trade Association on Tuesday, Wednesday and Thursday of last week, March 10, 11 and 12, did not prove the success for which the promoters confidently had hoped. Only eight cars, divided into three classes, started from Milwaukee on Tuesday and not one finished on Thursday with a perfect score. The best record was made by Ed Sanger, who drove a four cylinder Maxwell in the class for cars costing $1,800 and under, and who finished the three days' run with a penalization of 935 points.

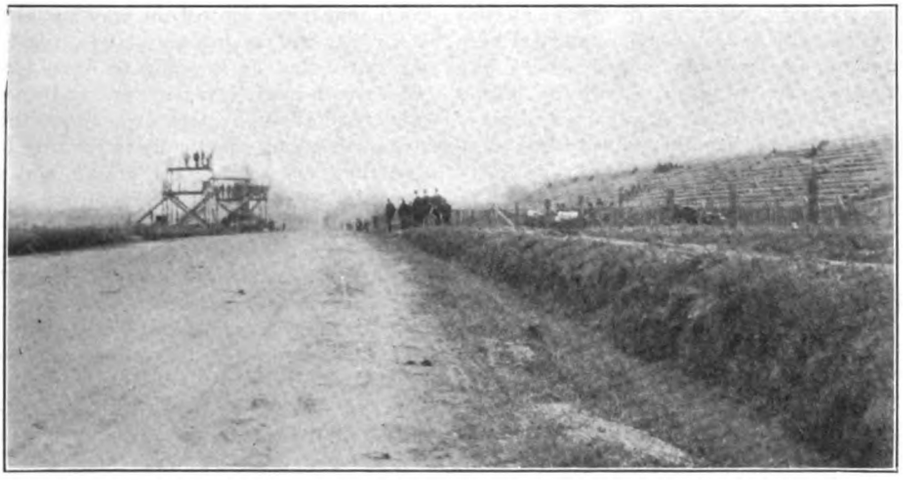
Oshkosh was the first day's destination and the eight starters left Milwaukee by classes in the following order: Cars selling at $1,800 and under—Frank Roessler, Rambler; A. J. March, Reo; Robert Zastrow, Jackson, and Ed Sanger, Maxwell. Cars selling from $1,800 to $3,000—L. A. Finch, Thomas-Detroit and Edward Collier, Rambler. Cars selling above $3,000—S. W. Hartley, Cleveland, and Hal K. Sheridan, White. According to reports from the Beer City the roads encountered between Milwaukee and Oshkosh were frightful, but notwithstanding the prevalence of deep mud a majority of the starters reached there without great penalization. Zastrow was penalized 25 points for breaking a hood seal and 90 points for cleaning a spark plug, while Collier was charged 25 points for breaking the transmission seal and subsequently 175 points for repairs. All the others had perfect scores.

The 160-miles run from Oshkosh to Beloit on Wednesday played all kinds of havoc with the remaining perfect scores. Not one of the cars reached Beloit on time, which was not strange in view of the deep rivers of mud and water that were wallowed through. The worse parts of the run were between Ripon and Brandon, and between Madison and Janesville. In many places the roads were so bad that the cars put through fields and woods to escape the deep slough that filled the roads. Sanger, who finished the first day with no points against him, had trouble with one of the springs that cost him 550 points in addition to an additional debit of 185 points for being over three hours late. Zastrow lost a little over 200 points for minor repairs and was charged 480 points for being that many minutes late at Beloit. A. J. March lost 13 points for repairing a bearing and was charged for breaking the seals of the gasolene tank and of transmission nine times. Sheridan lost 150 points for minor adjustments and 230 points for arriving late, while Hartley suffered a broken spring, which cost 1,940 points, in addition to 515 points for being late. Finch had trouble with the driving shaft of his car and was debited 3,000 points, while Collier was laid up all day with a broken pinion.

Bespattered with mud six of the original starters checked in at Mliwaukee on Thursday after a hard day's run from Beloit. Hartley was the first to finish, followed by Sanger. None of the drivers experienced as much trouble on the last leg of the run as they did the day previous. All the cars but one were penalized, but the loss in points was nominal. Sanger was the only driver to finish the day's run without loss of points. Collier, in the Rambler roadster, waited all day for replacements from the factory and arrived in Milwaukee on Friday, 22 hours 45 minutes late. The observer's card showed no record of the time spent upon repairs so it was only charged 1,365 points for being late. The other Rambler had not reported when the committee announced the results. The total penalties as announced were as follows:

Ed Sanger, Maxwell, 935 points; Robert Zastrow, Jackson, 965 points; A. J. March, Reo, 1,085 points; H. K. Sheridan, White, 1,750 points; S. W. Hartley, Cleveland, 2,680 points; L. A. Finch, Thomas-Detroit, 4,823 points; Edward Collier, Rambler, 1,365 points.

Bridgeport Wants Vanderbilt Race.



It transpires that Bridgeport, Conn., officially is in the field for the Vanderbilt cup race this fall. St. Louis and Savannah were already known to be anxious to provide a course for the race, but Bridgeport's candidacy was made known only last week.

SPIRITLESS SPORT AT SAVANNAH

Lytle and Salzman Take Honors from Thin Fields—But Georgia Turned Out a Great Crowd.

Unless the "big" race at Savannah to-day turns the balance, the promoters of the speed carnival on the Florida beach and the road races on the Georgia roads will be able to shake hands and call it a draw.

GRAND STAND AND OFFICIAL STANDS ON THE SAVANNAH COURSE

The road races typify the A. A. A. sentiment; the flights on the wave washed sand represented the A. C. A. antagonism. Held in adjoining states and although far from the center of disturbance, it has been an open secret that each side has viewed the efforts of the other with more or less jealous eyes. The Florida sandfest came near to being a fizzle. Entries were few, starters were fewer, and finishers were almost, if not quite, as scarce as hen's teeth. These conditions were paralelled by the Savannah Automobile Club's road races, for stock chassis, the first of which were decided yesterday, 18th inst.

The first race—the one for runabouts—over the level but picturesque and well oiled 18 miles course, hung with moss in many places, was won by Herbert H. Lytle, driving a 30 horsepower Apperson. He completed the 10 laps—180 miles—in 3:35:41. Only two others started and but one of them finished. Lytle gained more than a full lap on J. B. Lorimer (40 horsepower Thomas-Detroit). The third starter, L. J. Zengle (50 horsepower Pennsylvania), broke a rear axle on the second lap, after placing to its credit the fastest circuit, 18:54.

In the second race, 180 miles for stock cars not exceeding 575 cubic inches piston displacement, George Salzman (70 horsepower Thomas "Six") finished alone in 3:02:25. The only other starter, F. W. Leland (60 horsepower Stearns "Six"), was put out of the running on the fifth lap by a broken connecting rod.

It follows that there was mighty little of real interest or excitement in either race.

The breakage of the axle of the Pennsylvania in the runabout race after having a lead of 1 minute 35 seconds over the Apperson, gave the driver of the latter car clear sailing for the remainder of the race. The consistent driving of Lytle was one of the chief features. He drove seven of the ten laps in a little over twenty minutes each. His time varied slightly in the three other laps owing to his stopping to change spark plugs and to take on gasolene. The ill fortune of the game seemed to follow Lorimer in the Thomas-Detroit. The ripping off of a tire caused the loss of many precious minutes, and later he had to stop again owing to carburetter trouble.

Increasing his lead on each lap Lytle succeeded in gaining a full lap before the race was over. Lytle's time for each of the ten laps follows: 20:29, 20:27, 20:20, 20:32, 26:42, 20:32, 20:20, 24:04, 20:56, and 21:19. Lorimer's time for each of the nine laps follows: 23:45, 24:21, 26:05, 26:55, 23:57, 20:02, 24:33, 25:09, and 22:11.

The cars were sent away at two minutes' intervals in both races. The Thomas car was first away in the second contest, but at the finish of the first lap the timing showed that the Stearns car had a lead of 40 seconds. There was intense excitement when it was announced that the latter car had broken down on the back stretch, as it gave the Thomas car a walkover. The fastest lap of the day came in the third circuit of the 18-mile course. Salzman drove at better than a mile a minute, the time being 16:51. The time of the car by laps follows: 17:35, 17:02, 16:51, 18:00, 21:45, 17:53, 17:37, 17:23, 19:33, and 18:49.

Savannah's interest was real interest. The city council had declared the day a holiday and the mayor, with other city officials, was present. A monster crowd lined the course and the grandstand, which will seat 5,000 persons, was full to overflowing. The stand was alive with flags and bunting.

The judges' stand on the opposite side of the track was covered with flags of different nations, while club flags and the emblem of the American Automobile Association were conspicuous. The soldiers paraded in groups through the streets on their way to the course, and every kind of conveyance seemed to be headed that way.

PICTURESQUE STRETCH OF THE MOSS-HUNG COURSE

The grandstand was placed about 25 yards back from the road, and along the course for a half mile each way was a wire screen fence. A brass band kept the crowd in humor when the cars were out of sight. The course was policed by 300 soldiers, 60 policemen and 50 flagmen.

To-day, the big race, 360 miles, for which there are eight entries, will occur, and of course a "bigger time" is anticipated.

FRELINGHUYSEN IS "AGGRIEVED"

Thought Automobilists Would Seek to Compromise, but They Did Not—New Jersey Fight Grows Warmer.

It appears probable that when he appeared at the recent conference of New Jersey automobile clubs, Senator Frelinghuysen did so in the role of professional pilitician. He wore his stock smile and was as notable for what he did not say in defense of his "pickpocket" bill as for what he did say. At that time he was before a considerable crowd and at such times the professional politician usually is very circumspect. A few days later when two representatives of the New Jersey Automobile and Motor Club visited him in the insurance office in New York, where he earns a part of his living, they discovered a Frelinghuysen of another sort. He was disposed to be assertive, but he said enough to make fairly plain that the best he hopes to accomplish is to effect a compromise of some sort. He did not, however, obtain much comfort from the club men. When they left him, they were more than ever determined to fight Frelinghuysenism and all that it stands for.

"When Mr. H. A. Bonnell and myself interviewed Senator Frelinghuysen in his office in New York," said W. C. Crosby, chairman of the New Jersey clubs legislative committee in reporting the result of his visit," it was made clear that to get what they want, they have a fight on their hands which means fight from now to the end of election. The Senator seems to feel himself aggrieved because at the meeting of the automobilists, held in the local club on Friday of last week, he claims that no opportunity was given him to meet the automobilists in a spirit of compromise, and that no effort was made on the part of the legislative committee to meet on mutual ground.

"The Senator unalterably opposes any change in the speed limit, and while he claims that the license fees as proposed are excessive and too high, yet he places the responsibility of such license fees as have been suggested and proposed, on the Governor, and he further claims that to extend a tourist privilege in the State of New Jersey would bring about a condition that would not result to the benefit of New Jersey citizens or its highways.

"In fact, in the discussion, matters assumed such a serious position that the interview was closed by the request of the Senator himself, by using the expression, 'the interview can no longer be permitted'; the cause of taking such a position being that he was unaware that the Governor at any time stated to him, or showed to him by his conversation, that he was in favor of an extension of the speed limit, while the chairman of the legislative committee stated absolutely and unqualifiedly that the Governor had so expressed himself at the general conference in Trenton with the Governor, or by his expressions led those who heard him to the conclusion that he was in favor of a change in the speed limit, or in extending the speed limit to 25 miles an haur, or possibly 30, claiming that it was reasonable. While the Senator asserted that he did not hear any such expressions on the part of the Governor, the chairman of the legislative committee claims that the Governor was addressing directly the Senator in making his remarks or arguments in connection with a 25-mile-an-hour speed being reasonable, and one which would be more in accord with the use of the highways by automobilists, and yet be with perfect safety. The Senator unqualifiedly denied this, and the issue was taken, and it is a matter that can be very readily decided by the Governor himself, or by those present at the interview.

"In connection with the tourist privilege, if the autoists of this State are to secure for non-resident tourists the sovereign right of touring over the highways of the State, without paying a tax, they will have to fight for it, or secure it by the exercise of the constitutional right invested in Congress, and to that end it is most earnestly hoped that the great body meeting in Washington, which now has the proposed Federal license bill before it for consideration will find it to the interests of these United States not to permit individual States to erect bars and obstacles to prevent non-resident citizens who have conformed to the laws of their own State from enjoying the privilege of touring through or riding through a sister State.

"In regard to the question of license fees it has become an absolute necessity, and the automobilists may just as well face the situation to-day as at any other time, to fight the constitutionality of a law which permits the State Legislature to exact under the cloak of a registration or license fee a double taxation, which it is admitted has produced to the State in the last year something over $90,000, and which they deliberately propose with the distinct intention of making the department raise $200,000, it being admitted that personal taxation is already assessed against the owners of automobiles, and in the city of Newark personal property is assessed and automobile property is assessed also under a distinct and separate item.

"The Senator was told that unless the automobilists received some concessions in regard to speed, in regard to a tourist's privilege, and a license fee not in excess in any case of $10, that not only every effort would be made to defeat the proposed legislation in the two houses at Trenton, but the automobilists generally, the trade associations, the boards of trade and the manufacturing interests would be enlisted, together with the interests of the hotel associations, to fight the constitutionality of the law, on the ground of double taxation under the cloak of license or registration fees, and also to test the constitutionality of any law which requires that an automobilist, having conformed to the laws of his domicile State, shall be required to pay for the privilege of using the highways of another State, which is contrary to the sovereign right of every citizen of this great country, and in addition to this, every legitimate means will be used to defeat the Senator in his campaign in the fall for re-election. In order to get fair play from the automobilists' standpoint, every foot of the way has got to be fought; and as it now stands, the Senator states that he is going to have a conference with his fellow Senators and see exactly what position the legislators themselves will adopt, practically intimating that what they say will be the result, and the automobilists' or the manufacturers' interests will not be considered.

"In regard to the veracity, that was questioned on the part of the Senator, as to what took place at the conference with the Governor, or the representations made, they can be easily established by those who were present, and an effort will undoubtedly be made to provide such substantiation; that when a Senator misrepresents he is doing unqualifiedly and unjustifiably what he has no right to do."

Dealers to Fight Frelinghuysen.

With many out of town members included in the large attendance the New Jersey Automobile Trade Association, at its annual meeting in Newark, Thursday evening, 12th inst., gave full discussion to the proposed new automobile legislation. The association will fight the amendments to the existing law proposed by Senator Frelinghuysen, but will support the clause in the bill providing that lights shall be displayed on all vehicles at night. It was announced that the entire Hudson county delegation in the legislature promised to vote against the Frelinghuysen amendments.

All the old officers were re-elected for another year, while one new name was added to the executive committee. The officers are: George Paddock, president; J. W. Mason, vice-president; W. H. Ellis, secretary, and R. A. Greene, treasurer. The executive committee is made up of C. R. Zacharias, of Asbury Park; G. E. Blakeslee, of Jersey City; G. M. Russling, of Paterson; Inglis M. Upperson, F. L. Martin, Leonard B. Zusi and M. O. C. Hull.

Cop Sues Motorist for Damages.

Knocking over a policeman by running into him with an automobile may entail heavy expense. John J. Callahan, a former policeman of Pelham, has just brought suit in the Supreme Court at White Plains for $50,000 damages for injuries against William McCord, an automobilist of Greenwich, Conn., who, Callahan charges, knocked him over with his automobile when the policeman was trying to arrest him for speeding.

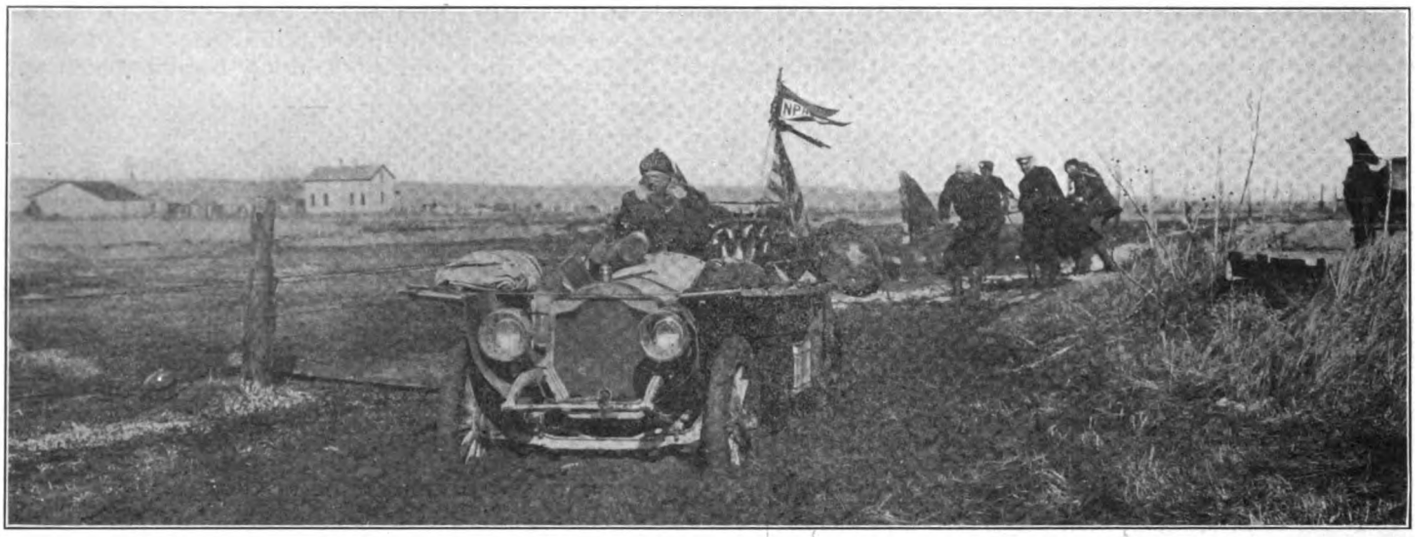
AMERICAN ENTRY 500 MILES AHEAD

Is Now Traversing Nevada—French Motobloc Quits "Race" at Omaha—Queer Features of the Contest.

The New York-Paris "race" has penetrated as far as Nevada, the sole American entry, the Thomas car, which now is being piloted by Harold Brinker, having put up at Ely in the Sage Brush State last night. The day's run was 141 miles, the total distance from New York being 2,859 miles. The Thomas's nearest competitor, the Zust, is 500 miles behind—at Granger, Wyo.; the De Dion, which was laid up at Grand Island, Neb., is 1,200 miles behind the Thomas, and the Protos, which arrived at Columbus, Neb., is 70 miles in the rear of the De Dion.



The story of the week is largely the story of other weeks—a story of struggles through snow, mud and water, with the American car far in front. The foreigners have had frequent recourse to the Union Pacific railroad repair shops, and the remarkable "race" spectacle has been presented of a car waiting three days for the arrival of a certain brand of tires and of other cars being loaded on railroad cars and shipped ahead for repairs and then shipped back again to resume the "race" where the breakdown occurred.

The biggest development of the week, however, was the apparent quitting of the French Motobloc. Mr. Godard, who is in charge of it, and who it is said is badly wanted in Paris to explain certain financial transactions during the Paris-Pekin "race," has found the strain too great for his pocketbook. The constant repairs and other "charges unforeseen," as they are described by Godard, induced him last night to load his car on a freight train at Omaha, where it had been shipped by rail and remained three days for repairs. The Frenchman says he means to journey by rail to San Francisco. At Omaha he said that, as he understood the rules of the "race," the contestants were not to be detained in the United States beyond three weeks and might take train on March 5, to be at Seattle on March 10 or earlier.

"Now," he added, "we have been on the way five weeks and have spent or strewn dollars by the road because the car has at each moment needed assistance to get out of the mire, snow, and mud in innumerable instances.

"On our part we have not emphasized the thefts by many people of our possessions, and when we object they tell us it was for the purpose of getting souvenirs. Then I cannot continue to carry along the Motobloc on account of charges unforseen and without end."

The Thomas car, in charge of E. Linn Mathewson, who succeeded Montague Roberts as its driver, rolled into Ogden, Utah, on the 15th, where he relinquished the wheel to Harold Brinker. The journey across Wyoming had been a struggle through snow, mud, shallow streams and over railroad cross ties. The car reached Evanston, Wyo., to which it was run on the tracks of the Union Pacific R. R. as a train, with the chief dispatcher of the U. P. in the role of conductor, the American car was able to avoid the impassable snow drifts on the road from Carter, but between this last named town and Church Butte, the roads, thick with soft mud, had to be used. On the 14th they entered Utah and encountered the worst roads of the trip from New York. The railroad tracks were again used to the detriment of the tires, three of which were destroyed.

THE AMERICAN ENTRY MIRED IN THE MUD NEAR MEDICINE BOW, WYO.

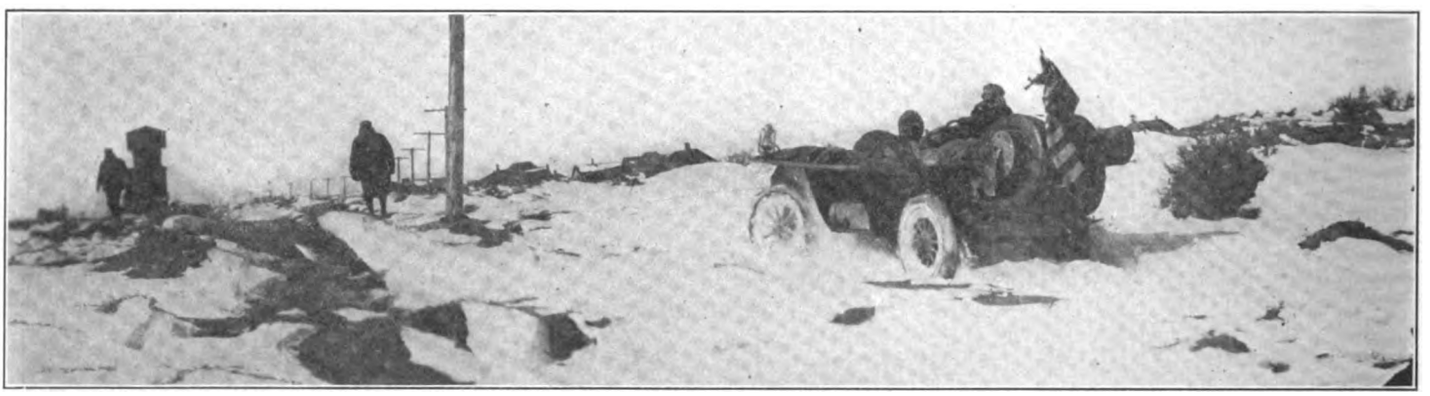
BUCKING THE SNOW IN WYOMING

Having run day and night for 25 hours, they entered Ogden completely fagged out. Of the last 50 hours Mathewson had been at the wheel for 47 of them. Snow and mud had been continually encountered, and he was glad that his work had finished as Ogden was the place where Harold Brinker was to succeed him as driver.

Until 4 o'clock of the following afternoon the car was given a general but hasty overhauling. At this hour, followed by a procession of the Ogden automobilists, the trip was resumed with Brinker driving. By way of variety several sand storms were run into and tortured those of the crew who did not possess good goggles; good roads were encountered, however, and no stop of any length was made until Cobre was reached, 182 miles from Ogden. The hardship of this journey lay in the fact that it was made perforce on empty stomachs. At Montello, after a run of 162 miles, the food that was obtainable was not fit to east, 20 miles further, in Lucin, Utah, the meal consisted of salt mackerel and tea. Cobre, however was able to furnish a good square American meal. Meanwhile the foreign cars were having their own troubles far behind.

After waiting 24 hours at Paxton, Neb., for a sprocket and chain the Zust made the trip to Cheyenne, Wyo., without incident.

Digitized by Google



Sirtori gave his Italian car on overhauling in Cheyenne, preparatory to crossing the Rockies. In that city the hospitality of the natives so impressed Haaga, the German mechanician on the Italian car, that he declared his intention of returning and making it his home after the car reached Paris. The overhauling in the U. P. shops was thorough and the 57 miles to Laramie was quickly traveled. After a stop for lunch they proceeded to Dana through heavy roads, which grew much worse as Medicine Bow was approached. When 5 miles from this town the car was abandoned until horses could be procured to drag it on.

Although the lighter Thomas had been able to cross the North Platte river on the ice, Sirtori was afraid to risk his heavy car in an attempt to do likewise. He finally arranged with the U. P. to cross on the railroad bridge, so he bumped over the trestle and was encouraged to find fairly good roads on the other side. With the car in good shape and the roads fair, good time was possible and he gained on the American, reaching Granger, Wyo., on Tuesday, after a 30 mile run. As the crew was tired, it was determined to sleep here.

The crew of the De Dion, after traveling without incident for 29 hours with neither food or sleep, determined to spend the night in Missouri Valley, Iowa. On Friday, the 13th, they broke a driving pinion and were forced to spend three days in Crescent, 10 miles from Omaha, waiting for the new parts that were being made in the U. P. shops of the latter city. Starting again on Sunday night. St. Chaffray announced that he hardly expected to catch the Thomas before Alaska was reached. Better roads were found the next day and the trip to Fremont was made with no incident other than an announcement from St. Chaffray that he had found a lot of screws and pieces of iron in the gear case. He presumed they had been put there by a practical joker. Three miles out of Grand Island the DeDion broke a spring and was towed back to await another from Cheyenne.

Hard luck was the portion of the Protus. Having made 38 miles after a day of travelling they reached Ames, Iowa with all tires used up. The character of the race was made evident. It waits even for tires from Europe. After a three day's wait the tires came and the car was driven the 100 miles to Dennison, in rapid time. Here another banquet greeted Lieut. Koepper, whose progress has been marked by these convivial spreads of various German societies. In one of his speeches Koepper remarked: "I have a good car, in perfect condition, able to make good speed, yet I find myself a month on the road and advanced only 1,500 miles. Our main trouble has been tires."

The Motobloc, having received a complete overhauling in Clinton, Iowa, where it had been shipped by train from De Kalb, 80 miles away, was pronounced fit to resume, and Goddard hit on the more or less happy thought of making up the 80 miles by running back 40 miles and then returning over the same route to Clinton. In this way he did the requisite mileage, but it was not over the prescribed course. However that matters little in "races" of this kind, and the trip was continued to Cedar Rapids, where the solid tires gave way to pneumatics. Continuing the car was lost somewhere and wandered about Iowa until set right by a native after it had been caught in a terrific rain storm which drenched the crew. Tama was reached Sunday night and Ogden on Monday. The heavy roads prevented over 17 miles being done for a whole day's work. Near Carroll something went amiss and the car was shipped to Omaha for repairs. After which Godard practically announced he had had enough and would quit.

HITTING THE HIGH SPOTS IN THE ROCKIES

Officials Chosen for the Carnival.

Having finally determined that the principal features of Carnival Week are to take the form of a night parade and a hill climbing contest—by day, of course—the New York Automobile Trade Association is now arranging the details of the celebration that is to mark the tenth anniversary of the introduction of automobiles in New York. The parade is to occur on the night of Tuesday, April 7. The officials for it were chosen late last week, as follows:

Judges: President Colgate Hoyt, of the Automobile Club of America; A. R. Shattuck, ex-President Robert Lee Morrell, and Dr. C. B. Parker, of the Long Island Automobile Club. R. G. Howell, the grand marshal, has appointed the following aides for the various divisions: W. I. Fickling, first division, composed of cars of 1903 and earlier, old racing cars, and the Briarcliff racers; I. H. Manning, second division, composed of dealers' stock models; Alexander Howell, third division, composed of decorated cars; H. E. Wagner, fourth division, composed of commercial vehicles. Each marshal will be allowed to appoint as many assistants as are necessary in his own division.

The exact date of the hill climbing contest has not yet been determined on, but it will be either Monday, April 6, or Thursday, April 9. The earlier date is favored by many on the theory that the contest would serve to open the carnival with an event that would attract wide attention. The Fort George hill, which was first used for a competition last year, has been selected as the course for the climb, the necessary permission having been obtained from the city authorities.

It is believed that the contest will call forth from 50 to 100 entries. The entrance fee has been placed at $10. The subdivisions include six classes for gasolene machines, an electric class, a steam car class, and a free-for-all. The restriction of the steam cars to one class regardless of price, while the gasolene machines have several classes based on the selling price, has drawn forth a protest from George W. Bennett, manager of the White company's branch. Mr. Bennett holds that the steam vehicle should be admitted on an equality with the gasolene machine in the price classification divisions, but the Carnival committee maintains that it has a right to do as it pleases.

Spain Modifies Frontier Rules.

One of the annoyances of automobile touring in Europe has been lessened by the modification of oppressive Spanish rules enforced on the Franco-Spanish frontier. These rules have been the subject of many protests. That the protests finally have awakened the higher authorities is indicated by an unwonted display of courtesy and leniency by the officials at the frontier.

FEDERAL RIGHT TO REGULATE

Constitutionality of Proposed National Law Argued Before Congressional Committee—Terry Makes Strong Points.

The hearing on the Cocks bill to provide for the Federal registration and numbering of automobiles when engaged in interstate travel was held by the committee on the judiciary of the House of Representatives at Washington, D. C., Thursday, March 12th, This bill, which was prepared by the legislative board of the American Automobile Association, attracted a notable gathering, and while despatches from Washington indicate that the bill will not be favorably considered, it stated that the bill is by no means lost. It is said that the committee adheres to the principle that the licensing of vehicles is solely a police power and therefore purely a state function and not within the constitutional scope of Congress.

Among the representatives of the American Automobile Association present were: William H. Hotchkiss, president American Automobile Association, Buffalo; Charles Thaddeus Terry, chairman Legislative board, American Automobile Association, New York; Frederick H. Elliott, secretary, American Automobile Association, New York; Russell A. Field, secretary, Long Island Automobile Club, Brooklyn; A. G. Batchelder, New York State Automobile Association, New York; C. H. Benedict, Automobile Club of Schenectady; Robert P. Hooper, Automobile Clubs of Germantown and Philadelphia; Paul C. Wolff, Pennsylvania Motor Federation and Automobile Club of Pittsburg; Jacob D. Rider, Lancaster Automobile Club; G. Douglass Bartlett, Quaker City Motor Club, Philadelphia; W. C. Crosby, New Jersey Automobile & Motor Club and Associated Automobile Clubs of New Jersey; R. A. Green, treasurer, New Jersey Automobile Trade Association, Newark; J. H. Edwards, Automobile Club of Hudson County, Jersey City; William H. Hunt, Automobile Club of Hudson County, Jersey City; Walter S. Schutz, counsel, Connecticut State Automobile Association, Hartford; F. T. Staples, vice-president, Connecticut State Automobile Association, Bridgeport; F. C. Donald, president, Chicago Motor Club, Chicago; Sidney S. Gorham, Chicago Automobile Club, Chicago; Robert B. Caverly, president, Automobile Club of Washington, D. C.; LeRoy Mark, secretary, Automobile Club of Washington, D. C.; Charles J. Forbes, Jr., secretary, Cleveland Automobile Club; Dr. A. B. Heyle, Cincinnati Automobile Club; Hon. F. H. Gillette, Automobile Club of Springfield, Mass.; L. R. Speare, Bay State Automobile Association and Massachusetts Automobile Club, Boston; Osborne I. Yellott, president, Automobile Club of Maryland, and Maryland State Automobile Association, Baltimore; John Bancroft, president, Delaware Automobile Association, Wilmington; F. E. Chapman, West Virginia State Automobile Association; George Ade, Indiana State Automobile Association; S. Royer Davis, secretary, Automobile Club of Philadelphia, and chairman of the Legislative Committee Pennsylvania Motor Federation.

Mr. Terry also appeared as general counsel for the National Association of Automobile Manufacturers. The Professional Chauffeurs' Club of America was also represented by President Sullivan and ex-President Walters, with Xenophon P. Huddy, Esq., its counsel. The latter discussed the bill briefly, urging chiefly that it be amended so as to permit the federal registration of chauffeurs while operating motor vehicles in states other than those of their residence.

The hearing was opened by President Hotchkiss, who briefly pointed out the necessity for interference on the part of the federal government to protect the motorists of the nation while operating in those states which require the registration of non-residents and use the requirement as a means to taxation.

The principal argument was made by Charles Thaddeus Terry, Esq., chairman of the Legislative Board of the American Automobile Association and representative of the National Association of Automobile Manufacturers. Mr. Terry's presentation, both of the facts which make such legislation desirable and necessary, and of the constitutional argument in favor of the bill, was stated by Congressmen present to be one of the most brilliant ever heard by the committee.

It was practically conceded by the committee that legislation of the kind asked for was necessary, and that it should be accorded if Congress had power under the federal Constitution to regulate the registration of motor vehicles when operated in states other than those of their owners' residences. It was apparent at the outset that, the question being an entirely new one and the powers of Congress being necessarily limited to its control over commerce between the states as granted to it by the Constitution, and as construed by the commerce decisions of the Supreme Court, the problem to be solved was whether Congress could in any way regulate the use of a pleasure vehicle, when operated on the highways of a state other than the state of the owner's residence, in other words, when engaged in interstate travel. It was apparent, also, that most of the members of the committee had grave doubts as to such travel being within the meaning of the word "commerce" in the Constitution. Hence, when it is stated that after a two hours' presentation by Mr. Terry several members of the committee stated that while they had been very doubtful, they had been either wholly or almost convinced that Congress had the power to pass the Cocks bill, the high merit of Mr. Terry's presentation will be appreciated.

In substance, his argument was that though the word "commerce" originally connoted an interchange of commodities from state to state, the supreme court had from decade to decade widened the meaning of the word until it now included not merely trade, but transportation, the interchange of telegraph messages, the carrying of lottery tickets on the person of a mere traveler, travel itself, in fact, intercourse between the states in the broadest possible sense of that word. It can be stated with some confidence, that as to this the committee seemed to agree with Mr. Terry. In other words, he demonstrated to the committee that Congress had power to legislate concerning the registration of the newest means of intercourse, or intercommunication, between the states.

Mr. Terry also called attention to a line of decisions by the Supreme Court, which held that under the commerce clause of the Constitution, the federal government had power to pass laws which would prevent one state from exacting license fees, tolls or taxes, either from vessels or from their pilots or masters, when plying navigable waters entirely within a state, other than the state where the vessel was enrolled; and called attention to the fact that there was in principle no difference between the natural highwtys of a state or nation, that is the waterways, and the dirt highways, and also that there was no difference in principle between a vessel navigating such natural highways, and a wheeled vehicle using such artificial highways. Asked by Congressman Malby of the committee, whether there was not a distinction between vessels engaged in interstate trade and purely pleasure vessels, Mr. Terry called attention to the case of the yacht "Yosemite," in which the Supreme Court held that there was no such distinction and that a vessel operated between ports of different states, and purely a pleasure yacht, was properly subject to a law preventing exactions by states other than that of its enrollment, and that this statute rested solely on the commerce clause of the Constitution.

While the chairman of the committee and several of its members repeatedly asked questions which indicated that they had grave doubts as to the constitutionality of the bill, Mr. Terry's argument made a deep impression and entirely convinced several of the committee. It is not likely that final action will be taken on the bill for some weeks, owing to other matters pressing on the attention of the judiciary committee, but, it is confidently expected by Mr. Terry and his associates, that such action will ultimately be favorable to the bill.

Interviews with members of Congress not on the judiciary committee, led to the conclusion that should the bill be favorably considered by such committee, the bill will pass without substantial amendment or opposition.

MUST GIVE TWO-THIRDS OF ROAD

Unusual Provision of Ohio's New Bill—Graded Fees and Other Features of the Measure.

Automobile legislation in Ohio has progressed during the present session as far as the passage in the Senate, on the 12th inst., of Senator Ward's bill which includes a provision for speed limitations which cannot be changed by local ordinance or laws. This feature of the measure, which passed with only one vote against it, threatens its future even in the Senate, where it will have to be reconsidered because of errors made in amending it during its progress. Now, it is said, certain senators from the country will endeavor to amend it so as to take from the State the power of speed regulation and restore it to the counties, villages and cities. The limits specified by the bill as it stands are 8 miles an hour in business sections of municipalities; 15 miles in other sections of municipalities, and 20 miles in the country.

The bill requires the registration of all automobiles by the Secretary of State, the scale of fees being $3 for cars up to 12 horsepower; $5, up to 20 horsepower; $10 up to 50 horsepower, and $15 for higher powered machines. Dealers get special licenses for $10 for each type of car. Owners must carry their certificates of registration with them, and the driver of a borrowed automobile must carry the written consent of the owner. Chauffeurs must register at a cost of $2 for license. Non-resident owners must only comply with road rules and the regulations concerning equipment, if they are registered in their own states.

License numbers must be displayed front and rear on machines. Bills, horns and brakes are required, and lights displayed must illuminate the license number.

The road rules require that the motorist must slow down and stop when signaled so to do by the driver of a horse vehicle. Also he must give two-thirds of the road to persons with horse vehicles whom he meets.

Motorists arrested are to have right of immediate hearing or of giving bail not to exceed the maximum fine for the offense charged. The Secretary of State is to register cases of arrest and conviction and notify all county clerks of the same.

Penalties are provided as follows: Fines of $25, $50 and $100 and 30-day sentences are provided for first, second and third violations of registration, speed, equipment and road rules sections of law. Using fictitious license number or one belonging to another draws fines of $25, $50 and $100 with 60-day sentences, according to the offense. Failure of chauffeurs to register draws fines of $50 and $100 and suspension of right to be registered for two years. Failure to show written consent from owner for use of machine draws penalty of $200 fine and six months' sentence. Revenues from this source are to be used for maintenance and repair of roads.

Anti-Tire Chain Sentiment Spreads.

Anti-tire chain sentiment has penetrated to the senate chamber at Trenton, N. J., and has resulted in the introduction of a bill by Senator Leavitt. It would amend the motor vehicle act by providing that no motor vehicle shall have chains on its tires when using gravel or macadam roads.

The Fairmount Park Commission of Philadelphia also has carried out its intention of prohibiting the use of chains on the tires of automobiles when using roads in the park. The commissioners heard automobilists on the matter several weeks ago, as reported in the Motor World, and in their rule, adopted on the 12th inst, they exempt Belmont avenue. As further indicating an intention to treat automobilists fairly they agreed to ask councils for money necessary to asphalt the north side of Girard avenue, between the bridge and Parkside avenue. This improvement is contemplated with the idea that it would be a convenience to automobilists bound for points on the main line who now use park drives.

Arkansas Automobilists Organize.

With promise of becoming a lively factor in the motoring world, the Automobile Club of Little Rock (Ark.) has organized in that city, to affiliate with the A. A. A. The officers chosen were: President, Moorehead Wright; first vice-president, J. P. Runyan; second vice-president, J. N. Heiskell; secretary, Irving S. Hirsch; treasurer, Perry Stifft. The officers named, with E. P. Ladd, C. A. Pratt, J. E. Osborne, W. B. Miller, and J. A. Van Etten, will compose the board of directors. Capt. C. A. Pratt was named as director to represent the Arkansas association on the A. A. A. board.

Kentuckians Incorporate State Association.

The Kentucky State Automobile Association, comprising the Louisville, Legington and Owensboro clubs, has been organized and incorporated with the following officers: President, Ira S. Barnett, of Louisville; vice-president, F. R. Toewater, of Lexington; secretary and treasurer, Walter Kohn, of Louisville; directors, Louisville club, Ira S. Barnett, Dr. Lindsay Ireland, Walter Kohn; Gluegrass Club, of Lexington, F. R. Toewater, E. H. Alexander; Owensboro Club, J. T. Dawson, Allen Reid. The club will affiliate with the A. A. A.

Planning for Road Around Two "Knobs."

Jacobs Ladder and Morey's Hill, the two famous and neighboring "rises" near Lee in the Berkshire Hills, on the route between Lenox and Springfield, Mass., may lose their terrors for tourists. Efforts are being made in Boston and elsewhere to raise a fund of $15,000 for the purpose of building a road around the two "knobs."

PREPARING FOR THE GLIDDEN TOUR

New Rules Will Not Permit a Tie to Remain Unbroken—Allowances Likely for Tire Troubles.

One feature of the revised rules for the 1908 A. A. A. tour and contest for the Glidden trophy that is certain to cause general commendation, is a provision that cuts the string the Buffalo Automobile Club has had attached to the Glidden trophy ever since it first was offered for competition. It is understood that the new rules will provide for a run-off in case of a tie between any two clubs. Under the old rules the trophy had to be distinctly won from the holding club by some other organization, and in 1906, when the Buffalo club was in a tie with some others, the Buffalo club retained the trophy. This year if the Buffalo club finishes in a tie with another one or two, it will have to fight it out with them on the road.

The rules have not yet been officially given out, but enough of their probable character is known to permit of discussion. The plan for awarding the trophy this year will be an improvement on that of last year. The desirability of a club being able to enter a team composed of one make of cars has been considered and one club will be allowed to spilt up nine cars into three teams of three cars each, or six cars into two teams. The trophy will be awarded on the basis of club teams, probably to the club having the most teams with clean scores, or in event of no clean scores, to the club standing best in the penalization table. The penalization system will be the same as last year.

Another interesting provision that probably will be made is one concerning deducting the time lost because of tire trouble. Many manufacturers object to having to make up the time lost in the repairs, because tire troubles are a gamble, pure and simple; but it was pointed out that if the rules provided for allowing the time spent fixing tire some would deliberately puncture a tire and repair it, in order to take time to let the engine cool, should it become overheated. It is likely that this objection will be met by a rule that time spent in tire work will be allowed, provided the engine is kept running.

Another interesting point about this year's tour is that all possibility of discussion among the committee in charge has been done away with and there will be one executive head to it, F. B. Hower, who was the actual manager last year, although a committee was nominally in charge. This definitely will fix all responsibility while the tour is in the field. It is supposed that Mr. Hower has learned to enforce rules and routes as they are laid down and not merely when and how he thinks they should be enforced.

FACTORS AFFECTING TIRE LIFE

Scientific Reasons for the Rapid Wear of Back Tires—Typical Cause Explained and Others Specified.

Many motorists have had occasion to wonder why their back tires wore out so much more rapidly than the front ones. Generally speaking, the all-inclusive answer to this question has been that the traction to which the drivers are subjected is sufficient to account for the difference. In a paper recently presented before the Royal Automobile Club of Great Britain, however, Mervyn O'Gorman, the well known scientist and pioneer motorist shows that a number of other factors also ought to be taken into account as having a very important bearing on the matter.

"Many parts of a car seem to have nothing to do with tires until one dwells upon their elementary functions," he remarks.

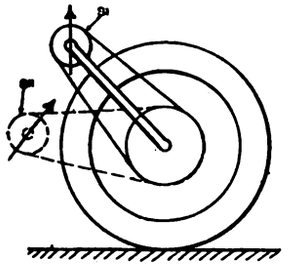

Fig. 1

"For example, nothing seems more inert in this connection than a distance rod. Considered as the piece through which the car is pushed forwards, it is known to be in compression and accordingly stiff. As being the piece which is connected both to the frame and the axle it must be hinged at the fixing, and as the sides of the car often rise and fall unequally on the springs, the distance rod must also be pivoted for side movement at the hinge. . . . .

"With a chain driven car the distance rod is often supposed to prevent the taut side of the chain from varying in tightness when the car body moves up and down on its springs. If it fails in this the drive to the road wheels will be irregular and the tire will rub. Looking into detail shows us that it does fail, and the question to be answered is simply this: Is the tire rubbing due to this cause negligible? To study this we will first suppose the car at rest, the back road wheels prevented from turning, and a very heavy weight put on to the chassis over one of the back springs. This lowers the chassis, and with it the front sprocket (Fig. 1), from the position S′ to S″, which we may suppose to be the extreme movement when the car "bumps," say, 8 to 10 inches.

"The distance rod prevents S′ from leaving a circular path round the back sprocket. The upper chain is carried round with it, and is obviously wound on to the back sprocket. At the same time a certain amount of chain is, for a similar reason, wound off the moving one. If the sprockets were of equal size, the amount wound off would equal the amount wound on to the

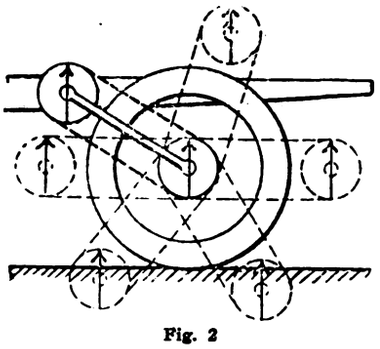

Fig. 2

other, and neither would turn on its axis, as shown in Fig. 2. But normally the front sprocket is the smaller, and accordingly it has to rotate as shown in Fig. 1. It is very important to appreciate the amount of this rotation and its direction. If a small sprocket moves once round another having a larger circumference, a length of chain equal to that larger circumference will be wound onto the larger sprocket. If,

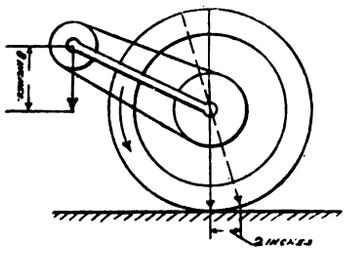

Fig. 3

then, the smaller sprocket is one-third smaller, as is common, it will have to rotate through one-half of a revolution, and proportionately for fractions of a revolution. The direction of its rotation will, as shown by the sloping arrow in Fig. 1, be clock-wise for a downward movement to the dotted position. It will be noted that this tends to turn the engine backwards, after taking up all the back loss or play in all the gears engaged, including the chain.

"In practice, when the car is not station-

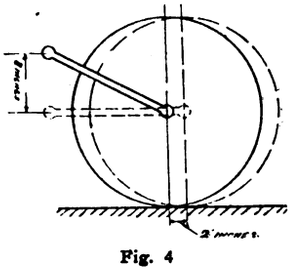

Fig. 4

ary, the converse is usually the case—namely, the front sprocket, S, is prevented from backward rotation by the engine or the foot brake—and the back wheel must unless the chain snaps, rotate forwards (the backlash having already been taken up by the engine pull). Every time the tire rides over a lump this occurs in some degree, and when, as sometimes happens, the car body oscillates vertically over the full range of clearance of the springs, the movement is greatly exagerated.

"It is easy enough to calculate the amount of movement, but it is more convincing to illustrate this forward rotation by a model made to half scale of a chain drive and road wheel. The front sprocket of the model is locked, and the road wheel free to turn. Taking a vertical downward movement of the springs of 8 inches, and the usual dimensions of wheel and sprocket given in Fig. 3, the wheel turns through such an angle that the tire slips forward 2 inches. Simultaneously the radius rod, in moving from a sloping to a more horizontal position, pushes the axis of the wheel through an additional space of 2 inches, as shown in Fig 4. It is now necessary to see how long an interval of time this movement takes. If the time is very short, the inertia of the car and engine respectively

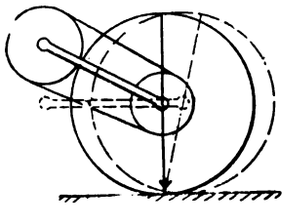

Fig 5

will prevent their moving forward, and the wheel will consequently have to skid. . . .

"A simple calculation shows that a bad road hollow 2 feet wide traversed at 40 miles per hour is passed in less than 1-29 second. Whether or not the wheel follows the profile of the ground on the first part of the down slope, it will be found in most cases that by the time it has struck the far side of the puddle and rebounds from it the car body will have started its downward movement. We have, therefore, the wheel moving up and the car body moving down with considerable velocity. As far as I could judge when noting this, the car had not moved three feet beyond the hollow before the bump occurred. At this speed three feet represents 1-20 second, and during this short time the car would either have to be thrust forward 4 inches, or the road wheels must skid round that amount.

"To determine which must occur is quite easy, thus: To thrust a 3,000 pound car forward 4 inches in 1-20 second, is to give it an added velocity of 80 inches per second, or 6.28 feet per second, or 4.4 miles per hour, and this would be done in 1-20 second. Such a push, if continued for a whole second, would give a car a velocity of 88 miles per hour (in one second), and would require a pull of 12,000 pounds. This pull is seven or eight times the adhesion between the ground and the back wheels, so that we may safely say that the wheel skids, both

Digitized by Google

at this speed and at speeds of one-half and one-third of this amount. The amount of the skid is 11 per cent., which represents work done in wearing and heating the road, raising dust and heating the tire. The power to effect this work is derived from the engine, and is a loss. If we suppose that on the average this loss amounts to only 5 per cent., because the average travel of the springs may be taken at 4 inches, we still find quite an important diminution of speed when the car is running all out. A remedy has occurred to me for this trouble in chain cars. I have two different sprockets from those we have been considering, both for the back and front. Contrary to normal practice, the small one is on the road wheel, and the large one in front. I will recall that we had 2 inches of skid due to the sprockets and 2 inches more due to the radius rod, and all I propose to do is to work these two skids in opposite directions, and as nearly as possible simultaneously. This I show in Fig. 5, where at the end of the downward movement of the sprocket the two movements have, within a certain margin of error, cancelled out. In this particular case the sprockets are of the same diameters as were used before, their positions only have been exchanged."

Speaking of cars driven by propeller shafts, the author refers to one which "has the curious property that, if fitted with a fine ratchet sprag, it can be caused to travel forward by the persons in the tonneau simply jumping up and down so as to work the springs, and illustrates the effect that a road shock has in causing the road wheels to turn forward, or, failing this, to skid.

"From the point of view of the heavy unsprung weight on the back axle, the propeller shaft car should be substantially harder on tires than the chain driven vehicle, and in some cases it is so. In other methods of construction such care has been taken of what I have called the 'radius-rod effect,' that in spite of the above indicated disabilities they are actually less wearing to tires. In the propeller type car the following provisions must be made: (a) A universal joint to allow the transmission to be flexible. (b) A push rod (corresponding to the radius rod of chain cars) to push the car along. (c) A torque rod, sometimes the springs, sometimes the propeller shaft itself, arranged to take the reaction of the drive; that is to say, a piece which tends to lift the front of the car when the engine exerts its power. Each of these provisions has problems incidental to it, which bear on the wear of tires. . . . . Both causes of wear mentioned in connection with chain driven chassis are found here in some degree: (1) The axle is forced backwards, because the horizontal projection of the push rod is increased. (2) The wheel is caused to rotate through an angle swept out by the push rod, and these two troubles are additive.

"Lastly, in those numerous cases when the push is taken through the springs the flattening of the spring gives a further movement backwards to the axle, and this movement is again additive. . . . .

"In the best type of live axle cars employing two universal joints, a slide, and a parallelogram of radius rods, the effect we have been considering is reduced in practice to less than one inch of tire movement for 8 inches of spring movement. All that is now wanted is that a demand should arise for cars which are easy on tires, as against cars which are simply cheap in capital cost."

By way of conclusion he adds a few other causes of wear in the rear tires of the car, not enumerated above, nor belonging in the same category, which are as follows:

"(1) Engine driving effort: (a) Even if the turning moment is uniform. (b) Un-uniform turning moment exaggerates this wear somewhat, but the un-uniformity of the ordinary engine of four or more cylinders is smothered under the other un-uniformities introduced elsewhere.

"(2) Clutch: (a) If fierce or let in roughly. (b) If fierce, especially when reversing, as the torque takes load off the driving wheels.

"(3) Radius rod effect: (a) With chains I believe this to be practically curable by adopting my relationship between sprockets and radius rod. (b) With propeller curable by two universals, one slide, and a proper parallelogram of distance rods.

"(4) Transmission: Part of the transmission often introduces an un-uniform conversion of speed—e. g., one universal joint (so does a chain, both in a small degree usually).

"(5) Weight causes bending of side walls, and therefore fatigue of tire. The drive of the engine transfers weight, say 100 pounds, to the back wheels, and adds to this effect. Unsprung weight on back axle causes heavy blows on the ground, the momentum of which adds further to this effect.

(6) Brakes cause skid and wear. The effect of applying the brake is unfortunately to take weight off back wheels. Unbalanced brakes: Loss of adhesion by applying brakes to only two wheels, thus doubling the wear on them.

(7) The differential, owing to its unfortunate property of turning the wheel with least adhesion."

Importance of Cylinder Temperature.

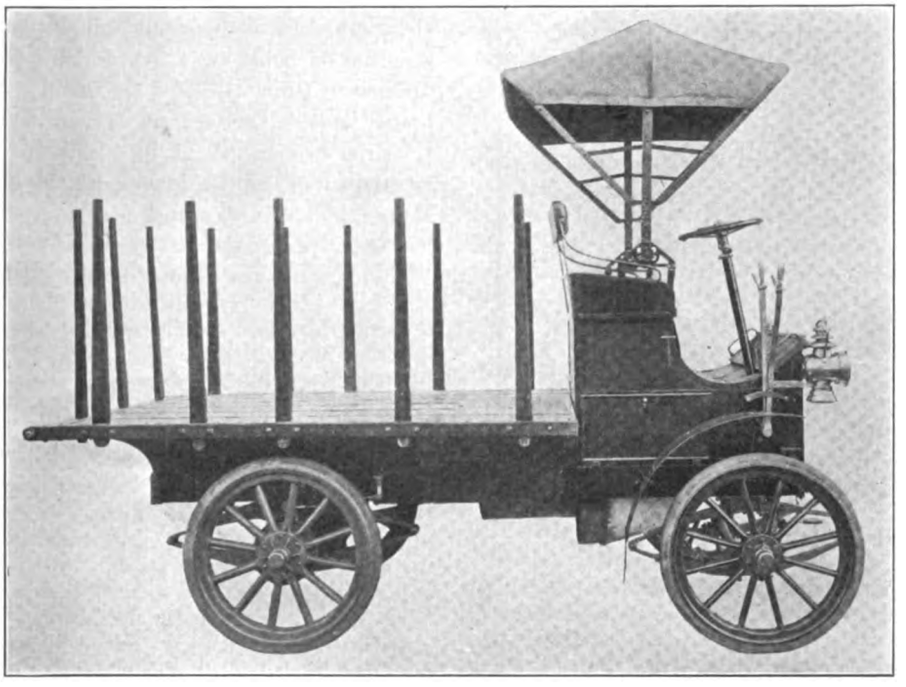
Cylinder temperature as a vital consideration to the efficient running of a gas engine, is seldom taken into account by the average motorist, at least to the degree that should be done. So long as the motor does not become hot enough to cause pre-ignition or cold enough to lose power, no further thought is given the matter. As a matter of fact, even comparatively small changes in the temperature of the jacket water may have considerable influence on both the power output and the fuel consumption, as is shown by the results of tests recently performed on a Napier engine for the purpose of proving just this point. The maximum power output and minimum fuel consumption were developed with a jacket temperature of 149 degrees, Fahrenheit.

When the cooling water had been reduced to 115 degrees, the power fell away 3.64 per cent., while the consumption increased 4.8 per cent.; while with the water reduced to 56 degrees, the power dropped to 6.6 per cent. less than its maximum value, and the consumption rose to 11.5 per cent. above its minimum. Raising the temperature of the cooling water, instead of increasing the power and reducing the consumption, as might have been expected, produced just the reverse effect. At 185 degrees, the power had fallen away .66 per cent. of its original value, and the consumption had risen 1.38 per cent., while at 212 degrees, the power was still 1 per cent. less, and the consumption .55 per cent. greater. Temperature was the only available factor in this instance, as both load and speed were held constant. The values manifestly apply only to the motor in question, but the principle involved is an important one.

Automatic Chamferer for Gear Teeth.

It is only a short time, comparatively speaking, since even the advisability of chamfering the ends of gear teeth in automobile transmissions was considered open to discussion. Since the practice has become generally accepted, the method of developing this all essential little finishing touch has been left largely to that ancient retarder of mechanical processes—hand labor—or to such special devices as the ingenuity of the shop foreman might contrive. The result has been more or less unsatisfactory, ordinarily, and expensive as well. A thoroughly modern and expeditious attachment for performing this work rapidly and accurately and to any desired profile, has now been developed by the "Long Arm" System Co., Cleveland, O. It may be clamped to the table of a small milling machine and is absolutely automatic. It will handle gears of from 2 to 9½ inch pitch, and of 4 to 10 diametral pitch, and when run at proper speeds, will chamfer about 12 teeth per minute. The attachment is fully described and illustrated in the "Long Arm" Co.'s Bulletin 25.

Driving Attachment for Buggy Wheels.



It would appear to be rather a difficult matter to attach a driving sprocket and brake drum to a common buggy wheel in such a way that it would be secure and durable, and it would prove quite as difficult a task as it appears unless just the right method were followed. The Cullman Wheel Co., Chicago, Ill., has developed a new method for effecting this attachment which is so important to the successful development of the modern high wheeled motor buggy, and a particularly simple one, too. Their counter shaft sprockets and differential gears which are designed for the same use are also an innovation in a very extensive line of sprocket and differential gearing.

TESTS OF TRUCK PERFORMANCE

Results of Six Months' Practical and Experimental Service—Cost of Operation Under Various Conditions.

With the commercial vehicle, unlike the pleasure car, the crucial point is performance, in contradistinction to mere power, weight, speed, wheel base, or appearance. From this standpoint, the construction of the Franklin "2,000-pound" truck, which, despite its name, has a rated capacity of 3,000 pounds, must be considered highly creditable as developed from the results of data gathered in the course of six months' use of three of these little vehicles in and about the Syracuse (N. Y.) factory of the H. H. Franklin Mfg. Co. In this connection, it is to be observed that the running costs are higher than would otherwise be the case under similar road and mileage conditions, because the vehicles were used for experimental purposes frequently, which would tend to raise the cost of maintenance above its normal amount.

FRANKLIN TRUCK USED IN TESTS OF PERFORMANCE

Lumping the performance of the three vehicles and averaging the result, the performance per vehicle worked out at an average of 10 trips per day, over 40 miles of road, with a load of 1,500 pounds, making a ton mile average of 30 per day. For this, the fuel consumption works out at 3.4 gallons, and the oil consumption at .22 gallons. Counting the driver's wages at the rate of $1.87 per day, the average cost of haulage per day amounts to only $2.70. This includes besides the driver's wages, the cost of fuel and oil, and the cost of time spent in repairing the machine. Exclusive of the wage item, this factor amounts to just about 83 cents. Whence the cost of operating the vehicle is worked down to 2¾ cents per ton mile.

As to hill-climbing performance, which, next to load carrying capacity and cost, is the most important item in the commercial vehicle catalogue, one of these machines, carrying a 3,000 pound load was driven up the hill leading out of the main gate of the factory, which is a 14½ per cent. grade, the Geddes street grade, which is of 11 per cent. pitch, and the Irving avenue grade of 12½ per cent. The James street hill, which is a grade of from 7 to 8 per cent., also was covered, and on second speed.

By way of an economy test, the same vehicle was run over city pavements for a distance of 14¼ miles, encountering only one hill, and developing a consumption of 1.12 gallons of fuel, which represents an average of 19.7 ton-miles per gallon. Oil costs worked out at 66 ton-miles per quart. The average speed during the trial was 10.4 miles per hour. With a load of 4,000 pounds, the hill leading out of the main gate of the factory was again climbed successfully, as well as the entire length of the Geddes street hill. By way of an economy test, 9⅛ miles of city pavement were covered with the same load, at the rate of 10 miles an hour and with a fuel consumption of 2⅝ quarts, which is an average of 27.8 ton-miles per gallon. The oil consumption for this trip was only ½ pint, or at the rate of 73 ton-miles per quart consumed.

The 1908 Model J truck, with which these performances were made, is the light and compact little machine shown in the accompanying picture. It is driven by the 16 horsepower four-cylinder, air-cooled motor, equipped with the famous concentric valves which are a 1908 innovation in the Franklin line. Another feature which largely aids in its meritorious performance is the worm drive, which gives an unusually smooth transmission of power, with an astonishingly low friction loss. The wheels are 32 inches in diameter, shod with 2½-inch solid tires in front and 3-inch in the rear; the wheel base is 76 inches, and with the stake body shown, the platform area available is 60 by 72 inches.

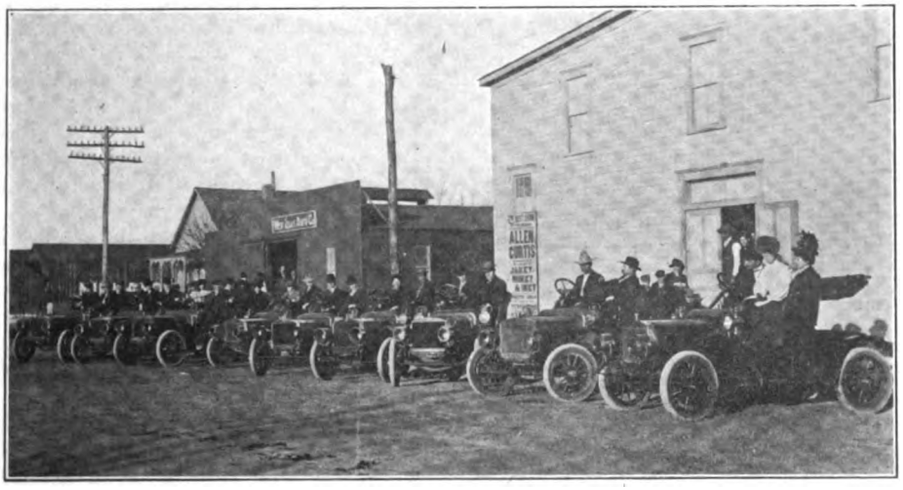
Electrical Lubricator Telltale.

Safe to say the motorist does not live who at one time or another, has not been annoyed by the stoppage of the lubricating system of his car, and who would not welcome an infallible indication that the oil either is, or is not, flowing as it should. That the usual sight-feed glasses are weak in being useful only when there is sufficient light to observe them, is well known, but it required British ingenuity to devise the "Orleans" lubricator tell-tale, which has recently been placed on the market. Briefly, it consists of a small cylinder containing a piston, normally held at the lower end by iona spring, and serving as a regular connection between the lubricator and the bearings which it is intended to feed. In flowing through it, the pressure of the oil must raise the piston against the tension of its spring sufficiently for it to uncover a port in the cylinder wall. So long as the oil is flowing, the piston is kept part way up in the cylinder. As soon as the flow ceases, however, the piston descends to the bottom of the cylinder, while simultaneously contact is made between a finger carried by the piston rod and an insulated ring in the top of the device, whereby an electric circuit is closed and an alarm bell is rung, notifying the driver that something is wrong with the lubricator.

Big Mileage in Business Trips.

The family baking of many households in the eastern part of Long Island has been facilitated, it would appear, by what Michael Bruckner, of Riverhead, regards as the wonderful record of the Maxwell car with which his distribution of yeast is made. Bruckner has made his trips regularly during the past eight months in all sorts of weather, and over every variety of good, bad and indifferent roads, covering a total distance of more than 15,000 miles. He claims to have expended less than $100 for repairs.

Economy of Horseless Fire Apparatus.



According to the fire commission of Springfield, Mass., the four automobile fire fighters in the department there, locally known as the "flying squadron," saves the city $189.20 per year, as compared with the cost of horse equipment. The commissioner therefore recommends the purchase of three combination chemical and hose automobiles to replace horse drawn apparatus, and expects to purchase additional chemical machines during the coming year.

HERDING CATTLE WITH MOTOR CARS

How Texas Cowboys Use Modern Methods in Their Business—Some of the Advantages that Result.

Having adopted the motor car for use in the ambulance service, police patrol, package delivery and nearly all other forms of transportation for people and inanimate objects it would seem that the field of usefulness for the gas engine was pretty well covered. But another industry has found that the motor vehicle is practical and advantageous and not a few automobiles are now used as a substitute for the cow pony for herding cattle.

COWBOYS AND THEIR MODERN EQUIPMENT

In the little town of Midland, in the heart of the cattle country of Texas, the men interested in the cattle industry are using motor cars in preference to horses. The collection of Mitchell automobiles shown in the illustration with the exception of three cars that belong respectively to a doctor, a banker and the sheriff, are the property of the cowboys and cattlemen.

In Texas a small ranch consists of about 2,000 acres, the others run up as high as several hundred thousand acres. These immense tracts of land are usually some distance from the towns and cities; the use of motor cars therefore is quite natural as the ordinary means of transportation between the ranches and the towns. But to use the power driven vehicle, in preference to the cow pony, when driving cattle, opens up an avenue of usefulness that was inconceivable a very few years ago. When gauntlets and goggles supplant spurs and a rawhide, another of America's picturesque institutions will have yielded to the onward march of commercialism and progress.

How Bavarians Blackmail Motorists.

Blackmailing automobilists is said to be one of the most popular among schemes whereby bucolic Bavarians eke out the income afforded by their farms. A recent victim has turned upon them, however, and a farmer named Hofmaier, who lives in the vicinity of Bamberg, is on trial this week for blackmailing no less a personage than Duke Francis Joseph of Bavaria.

The duke recently was driving an automobile in that neighborhood and the allegation against Hofmaier is that, seeing the duke's automobile approaching, he detached his horses from a farm wagon and purposely inflicted a serious wound upon the animal. When the duke came up, Hofmaier accused him of having run into his wagon and caused the injury to the horse. A crowd of about 100 peasants collected around the motor car, and refused to let the duke depart until he had paid over to Hofmaier all the money he had and promised to forward the farmer $40 beside. The duke related the incident to the prince regent of Bavaria, who advised him to bring suit against Hofmaier, as there was reason to believe this method of blackmailing was spreading.

Boston Restricts Official Motoring.

Though no accusation of "joy riding" has been made against Boston's fire chief, he has been ordered by the Fire Commissioner to use the automobile, furnished by the department, only for fires in the suburbs and "special occasions." The fire commissioner states that, while he personally is in favor of extending the use of automobiles in the department rather than curtailing their service, he must practice economy, hence the order. The department owns four automobiles, two used by the fire fighters, one by the commissioner and the other by the superintendent of repairs.

Mattoon Club's Annual Election.

At the annual meeting of the Automobile Club of Mattoon (Ill.) the following officers were elected: President, H. W. Clark; vice-president, F. E. Thatcher; secretary, George X. Chuse; treasurer, Dr. W. C. Lumpkin; directors, J. F. Chuse, Bert B. Cole, and E. B. Tucker.

MOTOR CARS IN ANTELOPE HUNTING

Montana Man Shows How It Can be Done —The Fleet Animals Overtaken in Long Chase.

"Look not mournfully into the past, it comes not again." The day has gone when "the speed of the antelope" will serve as an illustration of the greatest rapidity obtainable.

M. L. Wordman, a prominent citizen of Lewistown, Mont., an automobilist and a sportsman, recently conceived the idea of hunting the fleet antelope and using his National automobile in the chase. In company with a chauffeur he left his home town at about 8 o'clock one morning and started for a spring 65 miles away, where he thought the speedy animals would be found. Two hours later he arrived at his destination and after driving around for a few minutes he saw, with the aid of a powerful spy glass, a herd of about 25 antelope, lying down, five miles away.

The machine was headed toward the herd and as the country was almost level and the grass had been closely cropped by thousands of head of sheep he could easily distinguish all holes and stones at some distance away, and thus could safely drive at a high rate of speed. The car and its passengers were within a mile of the antelope when it was seen that they were becoming restless. Speed was diminished and another quarter of a mile was traveled when the group of fleet-footed animals took fright and bounded away with a speed that would have disheartened an ordinary hunter.

With slightly increased speed the automobile followed for a short distance, then the throttle was opened wide and the chase begun in earnest. Away went the pursued but far faster went the pursuers, and in two miles the gap between them was only 50 feet. Woodman raised his gun and fired, and although the car was going 35 miles an hour, an antelope dropped. The car was stopped long enough for him to take the wheel, then the chase was resumed. In a few minutes they had again caught up with their prey and the chauffeur took a shot. Another animal dropped, and as that was all that the Montana game laws allowed, the hunt was over.

When the dead antelope had been dressed they were loaded on the car. The homeward journey was completed by 4 o'clock in the afternoon, about 150 miles in all having been covered. Woodman says that this was the first hunt for big game in an automobile, and he adds, "but it is my intention to repeat it next year, having fully convinced myself that my National car can easily outrun an antelope, the fleetest animal to be found on the plains of the great West."

AUTOMOBILE AS SURGICAL AID

How It Made Possible a Major Operation and Saved a Life—Surgeon's Report of the Case.

Actual participation in a surgical operation, with the credit of assisting in the preservation of a human life is the most recent achievement credited to the automobile. W. B. Reid, M. D., of Rome, N. Y., tells the story in his report on a case of appendicitis furnished to the American Journal of Surgery.

Dr. Reid was summoned by telephone to consult with the family physician of Mr B., a farmer, and to operate, if necessary, in a case of suspected appendicitis. A run of fifteen miles in his automobile brought him to the patient's farm house about 6 o'clock in the evening. The professional history of the case up to that hour showed a rapid and alarming progress of a sudden attack of "cramps" in the stomach. Dr. Reid's diagnosis revealed what he describes as "acute appendicitis with perforation" and his advice in favor of an immediate operation was accepted. The kitchen was chosen as the operating room and the family "ironing board" was made to serve as an operating table.

"All of the country farm houses and many city homes have no other lights than oil lamps," Dr. Reid states in the beginning of his report, and he expresses his hope that the report may contain a suggestion helpful to anyone situated as he was, with a patient needing a major surgical operation, for which such light was inadequate, and whose condition would not permit of removal to suitable hospital surroundings. And here is where the automobile performed its part. It provided the necessary light. Dr. Reid says:

"The automobile was driven as close as practical to the kitchen window, the large searchlight lamp detached from the machine and passed into the kitchen. Rubber tubing ordinarily used for drainage was spliced by a glass drainage tube and used to connect the gas tank on the side of the automobile with the lamp in the kitchen surgery. The gas was then turned on, lighted, and the illumination found to be ideal. In fact, the light was just as good as in any well-appointed operating room."

After describing the operation, which was successfully performed, the patient eventually recovering, Dr. Reid concludes his report as follows:

"The pathological condition of the appendix, demonstrated at operation, suggests the probable outcome of the disease had we been obliged to have wasted time in his removal to a hospital. Next to the danger of time loss, we cannot but be impressed with the great danger in the mechanical disturbance of the parts in moving a patient in such a condition over rough country roads, which of necessity would tend not only to mechanically scatter the infection caused by the perforation, but by starting a peristalsis of the stomach and intestines, thereby also scatter the infection to such a degree as to cause general peritonitis.

"Next to the early diagnosis of the family physician and his prompt action, I feel that the automobile with its gas tank and lamp, was a strong factor in the means of saving the man's life."

Making a Mudhole Profitable.

Getting wealth out of holes in the ground is not confined to mining regions, for there are several reports of the somewhat rich yield certain New Jersey farmers are deriving from a mudhole on the Red Bank road a short distance this side of the intersecting road which leads to Matawan. Marshtown is the appropriate name of the little place nearest to the intersection, and conveniently located adjacent to the mudhole in question is a farm house. Several touring parties who made short trips through New Jersey on Sunday last returned to New York City with hard luck stories of muddy roads, and some of these parties had something to tell of this particular hole.

It was noticed by the tourists that when their machines settled into the hole there came no offer of assistance from the farmer and several of his friends who complacently stood at the fence watching the vain efforts to get out of the difficulty. When asked to bring his team and help the travelers the farmer demanded $5 for the work, which took but two minutes. This had to be paid, as the motorists were helpless and no other assistance was available for getting the car out of the mire.

There were four automobiles stalled at this place at noon Sunday, and it is said that a few days before four machines each paid $8 for a few minutes' use of the team. There is some suspicion that the road at this place is kept in bad condition as a trap for automobiles.

Jerusalem Sees Its First Automobile.

Of the many wonders that the ancient city of Jerusalem has witnessed, the latest, and to the present denizens of that city the most wonderful, was presented in the advent of the first motor car ever seen there. Of course it was driven by that indefatigable collector of touring records and experiences—Charles J. Glidden, of Lowell, Mass. Accompanied by Mrs. Glidden, he reached Perusalem rfom Haifa, Syria, on Friday, 13th inst. The sight of the great modern vehicle created a sensation among the residents.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

ARMED AUTOMOBILE IN REAL WAR

Practically Tested in French Rumpus in Morocco—Stood Strenuous Marches and Was an Effective Fighter.

What service the automobile might be able to render in war has been illustrated in a variety of ways in connection with military manoeuvers in our own country and abroad. What it can actually do under the stress of real war has been shown by a car engaged in the French rumpus in Morocco. This machine, says a foreign newspaper, is a Panhard, fitted with three quick-firing guns. It left Paris on December 9, last. Six days later it had progressed so far as to arrive at the scene of, and take part in, the most decisive engagement of the campaign—that at Ain Sfa, where its usefulness was such that its commander, Captain Genty (a well known French amateur racing motorist, by the way), has since been decorated with the Cross of the Legion of Honor, "for distinguished service in the Moroccan campaign."

This particular chassis was of standard type, 40 horsepower, with only normal clearance. Its facility of manoeuvering, therefore, must set at rest forever the pessimistic tongues so often protesting that "cars were all right on roads, but for use in the veldt or desert, or indeed on any broken ground, were quite impossible." The journey to the front of this mitrailleuse was sufficiently beset with trouble to form quite a test case. From a few hours after it left the ship nothing at all like a road could be used. Rivers had always to be forded, their banks in many cases having to be followed for miles before this was possible.

The land within a considerable distance of any African stream from the Nile downward is always of the most irregular character, and when once a stream was crossed the ground on the newly reached side would be found to bear miles of bowlders, sprinkled anyhow, so irregularly as to make mile-an-hour walking, or large stretches of cactus, whose "spines" were so assertive as to force even the wild animals to give such places a wide berth. Then would be met nine little 1-in-4 climbs, succeeded by stretches of feet-deep mud. Out of the quagmire a sandstorm would be encountered and the car so absolutely snowed up that she had to be dug out of the grit. The next incident, probably, would be the sinking of the car up to the clutch shaft in a desert bog. On the whole, it may be said with confidence that the ground covered could not have been more difficult to traverse, and the fact that the first of France's automobile machine guns was able to get up to and account for a number of the mobile Arabs has proved beyond all cavil its claim to recognition as a practicable unit of effective fighting strength.

FIFTY MILLIONS ASKED FOR ROADS

National Grange Gets Important Bill Before Congress—Plan for Highway Improvements in Every State.

Firty millions of dollars for the construction and maintenance of a national system of roads is the amount of assistance the farmers have asked of Congress, not for the benefit of any specified sections, nor in the interest of any special class, but for every section and for every class. Other efforts have been made in the past to secure the creation of some national commission under which the highway systems of the various States might be made productive of better results than thus far have been obtained, but they failed to command the support of the farmers, the largest class to whom the problem of good roads should appeal; and lacking this the bills introduced in Congress were suffered to die, in some cases because they were so worded as to give the impression that they were in behalf of some favored few.

Now, however, the farmers have taken the initiative, and the immense project for improved highways involved in a bill just introduced in Congress, has been formulated through careful discussion in the National Grange, the representative organization of the farmers, which, with more than a million members, is a power that may be relied upon to sway congressional opinion in a large degree. Especially is this the case in view of the fact that the farmer element has, in dealing with the matter, put itself in touch with all other interests to which the problem appeals, and through the active propagandism of such men as N. J. Batchelder, a former Governor of New Hampshire, has practically enlisted the sympathy and assured the co-operation of many other organizations throughout the country, representative of every class of people making use of the roads. The bill which the National Grange has succeeded in placing before Congress will, if passed, inaugurate at an early date a broad and comprehensive policy of road improvement that will affect every portion of the United States. The full text of the bill is as follows:

A bill to provide for the creation of a National Highway Commission, and for the construction, improvement, and maintenance of public highways.

Section 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That this Act shall include within its provisions any and all public highways within the territory of the United States which, in the judgment of the Commission hereinafter created and constituted, might be constructed, improved, or maintained to promote interstate commerce and trade and the postal service of the United States.

Sec. 2. That a Commission is hereby created to be called the "National Highway Commission," to consist of three Commissioners. The President of the Unted States shall, by and with the advice and consent of the Senate, appoint three Commissioners, who shall have a practical knowledge of road building and construction. Any vacancy which may occur in the Commission shall in like manner be filled by the President; and he shall designate one of the Commissioners to be president of the Commission. Each of the Commissioners appointed shall receive as pay and compensation for his services five thousand dollars per annum. The Commissioners shall remain in office subject to removal by the President for inefficiency, neglect of duty, or malfeasance in office.

Sec. 3. That it shall be the duty of said Commission to take into consideration, formulate, and adopt such plan or plans for the improvement, construction, and maintenance of such public highways, the improvement, construction, and maintenance of which shall, in the judgment of the Commission, acting in co-operation and consultation as far as possible with the duly constituted authorities having charge of the construction and improvement of the public highways of the several States, promote and facilitate interstate commerce and trade and the postal service. The said Commission may, prior to the completion of all plans and surveys contemplated by this Act, proceed to such immediate work as in the judgment of said Commission may constitute a part of the general system of works herein contemplated.

Sec. 4. That it shall be the duty of said Commission to superintend and direct such works as are herein contemplated, and to carry into full execution such plan or plans for the construction, maintenance, and improvement of public highways as may be devised and adopted by the Commission as herein contemplated, and to make such additional surveys and investigations and mature such additional plan or plans and to carry the same into full execution as may be deemed necessary to construct, improve, and maintain a system of public highways, advantageous for the purposes of interstate commerce and trade and the postal service, and to accomplish the object of this Act.

Sec. 5. That the Commission herein constituted and appointed may cause proceedings to be instituted in the name of the United States in any court having jurisdiction of such proceedings for the acquirement by condemnation of any land, right of way, or material needed to enable it to maintain, operate, and prosecute works for the construction, maintenance, and improvement of public highways, for which provision has been made herein, and to construct, improve, and maintain such public highways. Such proceedings to be prosecuted in accordance with the laws relating to suits for the condemnation of property for a public purpose of the States wherein the proceedings may be instituted: Provided, however, That when the owner of such land, right of way, or material shall fix a price for the same, which in the opinion of the Commission shall be reasonable, the said Commission may purchase the same without further delay; And provided further, That the said Commission is hereby authorized to accept donations of land, rights of way, or material required for the maintenance and prosecution of such work.

Sec. 6. That there is hereby appropriated, out of any moneys in the Treasury of the United States not otherwise appropriated, for the purpose of carrying out the provisions and objects of this Act the sum of fifty million dollars. The sum of not less than five hundred thousand dollars out of such appropriation shall be expended in each State of the United States, said sum of five hundred thousand dollars to be expended in each State at the rate of not less than one hundred thousand dollars a year. The said appropriation of fifty million dollars to be available at the rate of ten million dollars a year during the years nineteen hundred and eight, nineteen hundred and nine, nineteen hundred and ten, nineteen hundred and eleven, and nineteen hundred and twelve. If any of the appropriation herein made is not expended in the year named that portion not expended shall become available in the succeeding year or until expended.

Sec. 7. That the Commission herein created and constituted shall superintend, control, and expend for the purpose of this act all appropriations herein made, or which hereafter may be made for said purposes, or so much thereof as shall be necessary, and shall prepare and submit through the president of the Commission, to be by him transmitted to Congress at the beginning of the regular session in December of each year, a full and detailed report of all its proceedings and actions and of all such plans and systems of work as may be devised, in progress, or carried out by it, and of all such additional plans and systems of work as may be devised, matured, and adopted by it, with full detailed estimates of the cost thereof, and a statement of all expenditures made by it; and the Secretary of War may detail from the corps of engineers, or other corps of the Army, an officer or officers to aid them in their work, who shall serve without additional compensation to that now allowed by law; and all moneys hereby or hereafter appropriated shall be expended under the direction of the Commission in accordance with the plans, specifications, and recommendations formulated, matured, and adopted in accordance with the provisions of this Act.

City's Defense in Damage Suit.

Whether the city of New York can be mulcted for damages when any one is injured accidentally by officials engaged in the discharge of their duties is a question that will be determined in the disposal of a pending suit. Henry W. Scheeler has sued for $20,000 damages, on account of the death of his wife, which resulted, it is alleged, from injuries inflicted by a Health Department automobile on December 6, 1906. The Corporation Counsel, in defense of the city, will allege that the Health Department is clothed with the authority of the State, and that the city cannot be held to financial account for the results of accidents attending the performance of public duty.

Commercial Cars and Accidents.

In reckoning the number of accidents caused by automobiles it is not customary to distinguish between commercial and pleasure vehicles. For machines of the former type, the rate would naturally be expected to be very low. In Prussia, where this question has been taken up for the first time, so far as is known, returns covering the first half of the year 1907 showed that less than 1 per cent. of all automobile accidents were attributable to the agency of commercial vehicles. The motor vehicle registrations at that time showed about 25,000 passenger vehicles as against 1,112 freight machines.

The Week's Patents.

876,974. Piston. Harry A. Knox, Springfield, Mass. Filed Sept. 20, 1907. Serial No. 393,764.

1. A piston having a plurality of channels ond the head end thereof and extending inwards from the periphery thereof, the channels being arranged to register with the inlet ports at the end of the piston stroke.

876,978. Automobile Axle. Albert J. Lehman, Columbus, Ohio. Filed Sept. 27, 1907. Serial No. 394,788.

1. In an axle, the combination of the two tubes placed axially in line with each other, said tubes having gears affixed thereto at their inner or adjacent ends and stud shafts secured projectingly in their outer ends for the reception of the vehicle wheels, a bar loosely inclosed within the inner portion of said tubes adapted to hold said tubes in line and brace the axle from flexing at the middle, said bar provided with a spider, a gear on said spider to mesh with the said gears on the tube, and means whereby said spider may be driven.

877,083. Dust Shield for Self Moving Road Vehicles. John C. B. Ingleby, Leeds, England. Filed June 10, 1907. Serial No. 378,322.

1. A self moving road vehicle, provided with a dust screen consisting of a frame and a covering of fabric which is suspended below the bottom of said vehicle and serves to cut off the air between said screen and the ground from the air between said screen and the bottom of the vehicle body, substantially as and for the purpose set forth.

877,130. Igniter. George J. Schultz, New York, N. Y., assignor to Benjamin Briscoe, Tarrytown, N. Y. Filed Jan. 24, 1907. Serial No. 353,770.

1. The combination with a casing in the form of a bushing for entering into an ignition chamber, a sparking point, a body of insulating material carrying said sparking point and of smaller radius than the radius of the inner wall of the casing, a plate of translucent material carried by said insulating material, and means for clamping said plate against the casing for affording a translucent closure for the space between the insulation and the casing.

877,136. Carburetter. Alfred C. Stewart, Los Angeles, Cal. Filed March 7, 1906. Serial No. 304,651.

1. A carburetter comprising an inner oil chamber provided with an inlet valve, a casing surrounding the oil chamber, an air inlet to said casing and provided with a valve seat, said oil chamber being provided with an outlet opening, a deflector above said outlet, and a valve surrounding the oil chamber and guided to move vertically in the casing and forming therewith and with the oil chamber an air inlet chamber and a mixing chamber, said valve having a portion co-operating with said valve seat and a deflector portion co-operating with the aforesaid deflector, to vary the size of the air inlet opening into the mixing chamber, and the outlet from the mixing chamber in correspondence.

877,175. Speed Indicating Apparatus. Sylvester C. De Fore, Kansas City, Mo., assignor to Standard Speedometer Company, a Corporation of Missouri. Filed Nov. 30, 1906. Serial No. 345,606.

1. In a speed indicating apparatus, the

combination with an indicating device, of a governor mechanism comprising a pair of jointed arms carrying weights, a base connecting the arms of said mechanism at one end, and having a recess in its inner surface, a shaft rigidly mounted at one end and having its loose end seated in said recess, a grooved collar carried by said shaft, and adapted for longitudinal but not for rotary movement, an arm connecting the other ends of said governor arms and adapted for revolution in the groove in said collar, a circuit terminal carried by said collar, a second terminal adjacent to and adapted for contact with said first terminal, and means for revolving said governor mechanism.

877,176. Speed Indicating Device. Sylvester C. De Fore, Kansas City, Mo., assignor to Standard Speedometer Company, a Corporation of Missouri. Filed May 11, 1907. Serial No. 373,136.

In a speed indicating device, the combination of a suitable casing provided with a scale, a bell, a raised bracket adjacent to said scale, and having a longitudinal slot therein, a contact head, a set screw extending through said slot, and supporting said head between the bracket and casing, a crank shaft, an indicator arm rigid on said shaft and projecting beneath said bracket, and means for completing a circuit through said indicator arm, and head to energize said bell, for the purpose set forth.

877,217. Wheel Rim Fastener. Ralph L. Morgan, Worcester, Mass. Filed Jan. 12, 1907. Serial No. 351,956.

1. The combination with an inner wheel rim having an elevated bearing surface, of an outer rim bearing near one side on said elevated surface, and a fastening device supporting the other side of the outer rim from the inner rim, said inner rim having means located between the rims and entirely at one side thereof for clamping the fastening device thereto.

877,233. Wheel for Motor Vehicles. George D. Ross, Glasgow, Scotland. Filed Dec. 28, 1906. Serial No. 349,764.

1. A wheel for motor vehicles comprising, in combination, two wheels, one arranged within the other, the inner one being a pneumatic tired wheel while the outer one consists of a wheel or ring having an internal diameter larger than the external diameter of the pneumatic tire of the inner wheel and being free to move relatively with said inner wheel, said plates on the outer wheel and bearings arranged between the inner wheel and said side plates, said bearings being provided with anti-friction metal.

877,234. Acetylene Generator. Samuel W. Rushmore, Plainfield, N. J. Filed May 27, 1905. Serial No. 262,583.

1. In an acetylene gas generator, the combination with a main inclosing case, of a calcium carbid basket unstably supported therein, and means arranged in the case to impart a sudden shock to the basket, said means being operated by the shocks or jars sustained by the generator.

877,260. Pneumatic Tire. Thomas B. Tiefenbacher, New York, N. Y. Filed March 16, 1907. Serial No. 362,679.

1. A pneumatic tire for automobiles and other vehicles, consisting of an air-tube, a covering sheath surrounding the same, a layer of felt interposed between the air tube and the sheath, a covering layer of elastic material, and a tread of felt secured permanently to the outer circumference of said layer.

877,267. Gearing. Robert de Valbreuze, Levallois-Perret, France, assignor to Societe de Constructions de Vehicles Automobiles, Levallois-Perret, France, a Corporation of France. Filed May 31, 1907. Serial No. 376,584.

1. A transmission gear for motor vehicles comprising a casing, a shaft extending therethrough, a square shaft surrounding the driving shaft, a clutch member rotating with the driving shaft, a slidable clutch member mounted upon said square shaft and adapted to frictionally engage the other clutch member, a spring interposed between the shafts and bearing against said slidable clutching member, a counter shaft formed of two sections journaled in and extending through said casing, a differential gear mounted in the casing and connecting the sections of the countershaft together, a pair of gear wheels arranged within the casing and connected with the counter shaft, and a plurality of slidable pinions carried by the square shaft and adapted to engage with said gear wheels.

877,293. Gearing. Lucien Catel, Lyon, France. Filed March 29, 1907. Serial No. 365,275.

The combination of a stationary shaft, an oscillatory shaft connected to each end thereof and forming a continuation of the shaft, an arm connected to each oscillatory shaft, a rod connecting the arms together, a globular toothed wheel on each oscillatory shaft, and a pinion on a fixed axis meshing with each wheel.

877,294. Multiple Cylinder Engine. Frank L. Chase and Bertrand M. Young, Jamestown, N. Y.; said Young assignor to said Chase. Filed May 28, 1904. Serial No. 210,160½.

1. In a multiple cylinder explosive engine, the combination with a crank shaft, of a plurality of pairs of aligned cylinders, the cylinders in each pair located on opposite sides of the crank shaft, reciprocating pistons located within said cylinders and operatively connected to the crank shaft, intake valves controlling the admission of motive fluid to the cylinders, exhaust valves unseating inwardly, stems on the exhaust valves projecting to the exterior of the valve casings, a cam shaft journaled adjacent the stems of the exhaust valves, cams on the cam shaft adapted to successively actuate the valve stems and unseat the exhaust valves, a longitudinal shaft extending at right angles to the cam shafts, beveled gears connecting the corresponding ends of the cam shafts to the ends of the longitudinal shaft, meshed spiral gears on said longitudinal shaft and the crank shaft, and means for adjusting said spiral gears to properly operate the cam shafts when the engine is reversed.

877,377. Starting Device for Explosion Engines with Four Cylinders. Hippolyt Saurer, Arbon, Switzerland. Original application filed Oct. 6, 1906. Serial No. 337,707. Divided and this application filed Sept. 14, 1907. Serial No. 392,913.

1. In a four stroke cycle explosion engine with four cylinders, the combination with four spring pressed inlet valves in the four cylinders, of a connection on the four cylinders above said four spring pressed inlet valves and comprising a cylindrical bore in its middle with four openings and four separate channels leading therefrom to the spring pressed inlet valves, and a rotary tubular distributing valve mounted to turn in the cylindrical bore of said connection and provided with two apertures and so driven as to make one revolution on every two revolutions of the crank shaft, said connection being provided with two passages for each connecting two of the four channels.

877,405. Friction Clutch. Jules Caillet, Paris, France, assignor to Societe Anonyme des Automobiles Peugeot, Paris, France. Filed Sept. 10, 1907. Serial No. 392,127.

A friction clutch member comprising a clutch cone, semi-circular grooves provided on said cone and lying along elements of the sone surface, hollow india-rubber rods located in said grooves and slightly protruding beyond the circumferential surface of the cone, a leather envelope extended upon the cone surface and upon the protruding portions of the hollow india rubber rods, and small plates fixed to the cone opposite said rods to prevent same from slipping out their housings, substantially as described and for the purpose set forth.

877,437. Clutch. Charles B. King, Detroit, Mich., assignor to Northern Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed April 3, 1905. Serial No. 253,586.

1. In a clutch mechanism, the combination of a cylinder having one end closed, a flange fixed to the edge of said cylinder around its open end and extending part way to the center, a disc in said cylinder between said flange and the end of said cylinder, means for connecting said disc toward its center with the transmission mechanism, and means for supplying fluid under pressure to said cylinder back of said disc to press it against said flange to bind said disc and flange together for the purpose described.

877,438. Friction Driving Mechanism for Automobiles. John W. Lambert, Anderson, Ind. Filed Dec. 13, 1906, Serial No. 347,601. Renewed Sept. 6, 1907. Serial No. 391,702.

1. A friction driving mechanism comprising a friction disc, a driven friction disc, a rock shaft, means for moving said shaft, means connected to said shaft for bringing the driven disc into engagement with the friction disc, a pair of thrust wheels, means connecting said wheels to the rock-shaft whereby said thrust wheels will be brought into engagement with the friction disc on the opposite side thereof from the driven disc, and a stop device to limit the pressure of the thrust wheels on the friction disc without limiting the pressure of the driven disc on said friction disc.

877,471. Elastic Tire. Mathieu Brun, Lyon, France. Filed Sept. 27, 1906. Serial No. 336,430.

In a tire an elastic member comprising an outer part of elastic material externally smooth and having interior corrugations, an intermediate corrugated metallic resilient part whose corrugations engage those in the outer part, and an inner part of elastic material internally smooth and having exterior corrugations engaging those of the metallic part substantially as described.

877,512. Anti-Slipping Device for Tires. William T. Maxwell, Pittsburg, Pa., assignor of one-half to George W. Eberhardt, Pittsburg, Pa. Filed June 25th, 1906. Serial No. 323,264.

1. An anti-slipping device for tires comprising in combination a series of securing means on the rim arranged alternately on opposite sides and in staggered relation, a chain member connected to each of said securing means and extending outwardly beyond the rim and ending in a hook, and a

Digitized by Google

continuous chain extending in zigzag manner over the tire face and having links thereof engaging said several hooks.

877,629. Pneumatic Wheel and Hub. Hamilton A. Brown, Lehigh, Iowa. Filed Nov. 1, 1906. Serial No. 342,150.

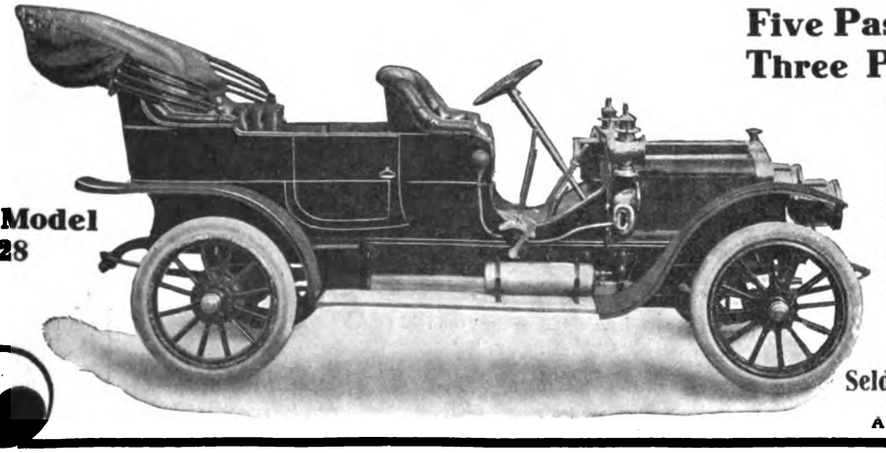
1. In an elastic wheel, a solid hub having a continuous concove groove in its periphery and anti-friction rollers on its side faces, a solid circular frame having a continuous concave groove in its inner face, a pneumatic tube between the hub and the circular frame and the hub and the frame connected by circular plates fixed to the side faces of the circular frame and provided with openings for the purpose stated.

877,656. Spark Coil. August R. Luschka, Chicago, Ill., assignor to Motor Specialty Manufacturing Company, Chicago, Ill., a Corporation of South Dakota. Filed Oct. 29, 1906. Serial No. 341,005. Renewed June 22, 1907. Serial No. 380,241.

1. In a spark coil of the type described, the combination of a secondary coil or winding, and a condenser arranged at the low tension or grounded end of said secondary coil.

Self-Interest is the Most Practical Kind of Interest

It's the kind of interest that has led the leading top manufacturers to use Autofoid instead of leather. Autofoid isn't merely "just as good" as leather. It's better than perfect leather and comparatively little leather is perfect.



All Autofoid is perfect.

It's uniform in quality and size—no waste—and posssesses all the good qualities of leather without the imperfections of leather.

Autofoid is a Twentieth Century development. It will amply repay anyone interested, to investigate it.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches, leaves the automobile with its original new lustre, without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish, from the clearest white to the darkest black.

Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all automobile dealers. Price, 60 cents per bottle.

Catalog, largest of the kind, mailed on request.

FRANKLIN Automobiles

Is air-cooling practical? What does it do? What is the benefit?

Nobody ever questioned that if air-cooling will cool it is the ideal method. But the question still comes up "will it cool?" Look into that fairly—

Last August a Franklin Type D automobile ran from Chicago to New York in less than 40 hours, cutting the water-cooled record 18 hours, 50 minutes.

A machine could not be "coddled" and make that record. It must be driven hard. In fact this Type D beat the express train that carried the relay drivers between three of the stops, else the record would have been cut still further.

The 15-day run of a Franklin Type H automobile from San Francisco to New York in August two years ago is also still untouched.

The Franklin D engine ran 7 days without stopping, in a hot Chicago salesroom, and again at Cincinnati it ran 18 days, 3,312 miles, over bad winter roads. In this run the Franklin motor was kept going every minute and only stopped finally when the emergency brake was pulled by mistake.

Finally 5,328 Franklin automobiles are in daily use.

Can anyone doubt that Franklin air-cooling is completely practical?

You gain simplicity. Water-cooling is a complicated system. It increases the liability to trouble. If the water boils there will be over-heating. This can't happen to the Franklin motor. The temperature is more constant and more efficient. It gets more work out of the gasoline. You save the extra weight of water-cooling apparatus. The power is not handicapped. It can do more. And with the Franklin shock-absorbing construction the power can always be comfortably used. The operating expense is light; and you get all the benefit of it.

No other automobile weighing under 2000 pounds will do the work of the Franklin family touring-car Type G which weighs only 1600 pounds.

No automobile but a Franklin will carry people as far in a day and as comfortably as the Franklin 5-passenger Type D; yet it only weighs 2200 pounds. The average 5-passenger automobile weighs a third more.

The 6-cylinder, 7-passenger Type H is the ablest and easiest touring-car in existence, yet it weighs only 2600 pounds—a thousand pounds less than the average 7-passenger automobile.

Doesn't the air-cooling question answer itself?

Ask For What You Want When You Want It

If you were about to buy a house and the agent told you that the method of heating it was optional with you, and that for say $500 you could have steam, hot water or hot air, would you tell him that so long as the price was the same it was immaterial what sort of a plant was installed? Not much! You'd specify. For heating is one of the vital things about a house.

MORGAN & WRIGHT TIRES

represent a similar vital part to an automobile. They probably have as much or more to do with a motorist's pleasure or annoyance as has any other one thing about his car. Then why not make sure of good tire equipment? Why not specify? Once you use Morgan & Wright tires (if only one or two in connection with other tires) for a few thousand miles, you will understand why we urge you to GET THE SPECIFYING HABIT.

There is no method of making friends equal to the method of making good.

Have you heard from Florida?

The single cylinder Cadillac driven by Dr. W. N. Slinson won the Jacksonville to Miami endurance run, 371 miles over some of the worst roads in the country, beating its closest competitor by 75 miles.

The other contestants were two and four cylinder cars

A telegraphic report from Palm Beach, Fla., under date of March 15th, and printed in the New York "Tribune" of March 16th, says:

> "Nevertheless the route laid over a course that offered almost every kind of obstacle for a contest of its kind and the highest praise is deserving of the 10 H. P. Cadillac driven by Dr. W. N. Stinson, of Jacksonville, which came in first in the actual running time of 30 hours and 18 minutes."

The New York "Evening Post", under date of March 13th, prints the following telegram from Miami, Fla.:

> "Miami, Fla., March 13.—Dr. William Stinson finished the Florida road race today at noon, **fully seventy-five miles in advance of his nearest competitor.** His official running time for the 371 miles was 37 hours 19 minutes; his actual running time being seven hours shorter. He drove a 10 horsepower Cadillac runabout, which carried three persons."

Cadillac Wins Three Prizes In One Contest

The New York "Globe" says, March 13:

> "Dr. Stinson's Cadillac is in Class B, and wins the Fort Pierce cup, the first prize in this class, also the Palm Beach cup for the car in this class that made the fastest time between Fort Pierce and Palm Beach. The Miami trophy also goes to the Globe car (Cadillac) because it made the best all-round showing on the whole run, irrespective of power."

Cadillac Motor Car Co., Detroit, Mich.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

Clean Sweep for the White in California Hill Climb

The White Steamer won all three events in which it was entered in the hill-climbing carnival held at San Francisco in connection with the recent automobile show. A 30 H. P. White touring car won the class for cars costing up to $3500, and a 20 H. P. White touring car won in the $2500 class. In the free-for-all, the same 30 H. P. car, with body removed, again triumphed. It made the climb in 1:38⅘, which is 16 seconds faster than that made by its nearest competitor.

The superiority of the White in hill-climbing has been demonstrated in every public contest in which it has competed or, more properly speaking, been allowed to compete. Hill-climbing ability is the true test of real power, of available power, of power at the rear wheels, and it is evident that hill-climbing contests furnish the real demonstration of what the various systems of motive power can do, and that the tables of "rated horse-power" are of purely theoretical interest.

Triumph Grease, What Is It?

¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

As It Was In The Beginning

The "Maxwell"

Car is now and (I promise) ever shall be an honest Car — honestly designed — conscientiously built — truthfully sold and in good faith backed up by its makers after it is in the hands of the buyer.

Times and conditions may change, but principles never do.

Maxwell principles of construction—chief among which are Thermo-syphon cooling; Unit Power Plant with three point suspension; and metal body,—are sound; all have been time-tried and road proven.

Here and there you'll find a maker who has adopted one or more of these Maxwell features, but only in Maxwell Cars do you find a combination of all of them.

I always feel sorry for the maker or sales manager who finds it necessary to contradict year after year all he has said previously, or who must devise new "talking points" to cover up past mistakes. I feel more sorry for the people who are beguiled into buying his cars.

Maxwell advertisements of four years ago expounded the same theories and principles as do those of 1908—and those of next year will be consistent with this. That's only one expression of Maxwell stability—it's one reason why Maxwell owners are such a contented lot.

Our catalog is free.

Crank Shaft on Center

Rambler

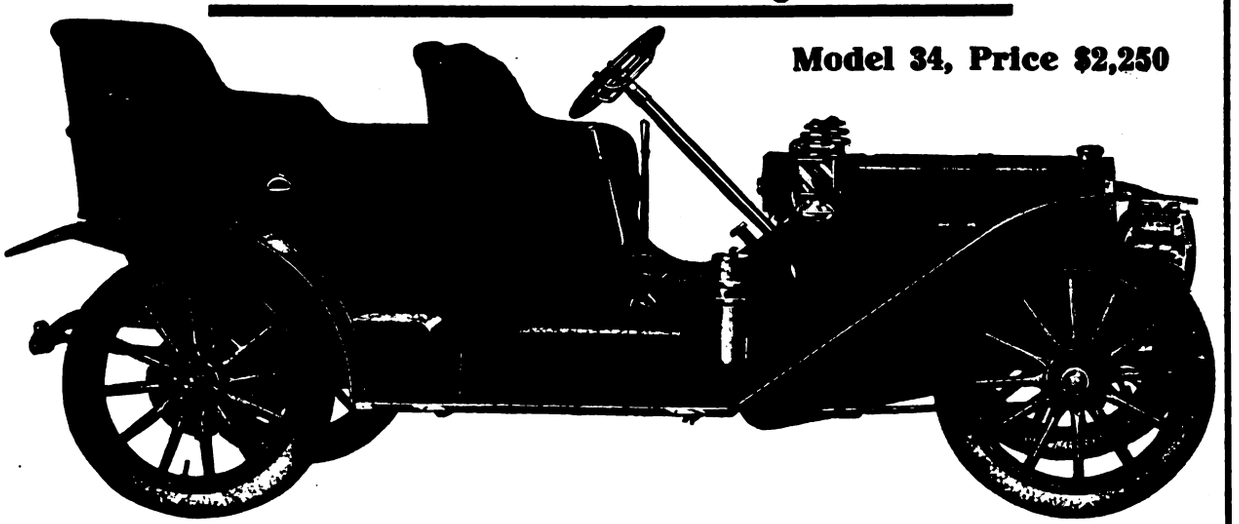
Crank Shaft Offset

Why the Offset Crank Shaft

One of the greatest improvemen·s in motor construction is the offset crank shaft. Its advantages are positive and direct.

First—By practically eliminating the dead center the efficiency of the motor is greatly increased through the greater leverage and more direct thrust from piston to crank shaft.

Second—Increased life of the motor through reduction of side thrust on cylinder walls and consequent saving in wear.



Third—Reduction in vibration and increased steadiness of running through more direct application of power generated in the cylinders.

Like many other fundamentally good features this must be done right and in the Rambler it is right both theoretically and practically and the result is a motor that combines the highest degree of efficieny with long life and economy of operation.

It is this and other features of equal value that make

The Car of Steady Service

Model 34, Price $2,250

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, March 26, 1908. No. 26

WINTON WOULD MAKE DIRECT SALES

Issues a Suggestive Statement, but Leaves His Attitude Toward Agents Open to Considerable Speculation.

Reports are afloat that the Winton Motor Carriage Co. has abandoned the agency system and hereafter will deal direct with purchasers. They undoubtedly grow out of the company's recent announcements advising intending buyers that the surest way to obtain lasting satisfaction is to purchase from the manufacturers themselves, which advice has been printed in the form of advertisements and circular letters, many of which have found their way into Winton agents' territory. That many of the agents are considerably perturbed is not to be denied, but when Manager Churchill of the New York Winton branch was asked whether the announcements indicated that the company had broken away from agencies or whether they presaged a move of the sort, he said he was not in position to make reply.

"I have no information to that effect," he said. "The agents attached to this branch have not been disturbed and have expressed no dissatisfaction. Of course, we think pretty well of the branch house system, but more than that I cannot say. Definite information must be obtained from the factory."

Sales Manager Shanks already had issued a statement bearing on the subject in which while he unequivocally suggests the advantages of "patronizing the maker direct," he does not make plain whether the company has or intends to cut loose from agents. He says:

"A protest against our statements came to us the other day from a prominent dealer in Pittsburg, but, oddly enough, the protest itself rather supported our arguments. For this dealer, proclaiming that he is not among those dealers who frequently shift agencies, added that he had held a specified agency three years. If an agency connection of three years is one of which a dealer may be proud (and it probably is), doesn't that alone serve to show that few agencies continue as long as three years? Any doubt that may exist on this point readily can be dispelled by reference to agency directories covering two or three years. It will be found that not two per cent. of all the dealers in America are handling exactly the same lines now that they were in 1906—two years ago.

"To provide a remedy for this ill, the Winton company owns and operates its own branch houses in ten of America's greatest cities. These branches are devoted exclusively to Winton cars and are not subject to the shifting of agencies. It is the purpose of each branch to give Winton owners thorough and enthusiastic co-operation and satisfaction, not only when the car is new, but so long as the owner retains it, whether that be two years, or ten years, or more. And the buyer is best assured of such treatment when he patronizes the maker direct, for then he knows that the seller's interest and loyalty will be centered upon the same make in future years that it is to-day."

Hercules Tied up by an Injunction.

The Hartford Suspension Co., maker of the Truffault-Hartford shock absorbers, has been granted an injunction against the Motor Car Equipment Co., of New York, restraining it from manufacturing, selling or using the Hercules shock absorber, which the equipment company already had ceased to market. The injunction grows out of the suit brought by the Hartford company alleging infringement of its patents, No. 303,589.

White Company Opens Pittsburg Branch.

On April 1st, the White company will open a branch office in Pittsburg, having secured the new and commodious garage at 138-148 Beatty street, formerly occupied by the Liberty Automobile Co. William B. Yoder will be in charge of the branch; his territory will include the western counties of Pennsylvania.

POPE RECEIVERS ATTACKED ANEW

Toledo Interests File Second Petition for Their Removal—Both Cases to be Heard To-morrow.

Petitions inspired by the Toledo interests unfriendly to Albert L. Pope, and which seek to have him removed as receiver of the Pope Motor Car Co., are becoming so numerous that it soon will be difficult to keep count of them. In addition to the petitions to that end filed in the United States Circuit Court at Toledo last month, and in the United States court at Indianapolis only two weeks ago, a second petition was lodged with the court at Toledo on Friday last, 13th inst. The ostensible petitioners in the latter instance are the Northern National Bank of Toledo, the National Bank of Commerce and the Bostwick-Braun Co., of Toledo, and the Capital National Bank of Indianapolis, but the same attorney is the moving spirit in both cases. Judge Taylor set to-morrow, Friday, March 27th, as the time for a hearing on both motions. Receivers Pope and Yule and their attorneys are in Toledo and it is probable that the matter will be threshed to a finish. The day before the second Toledo petition was lodged, Albert L. Pope filed a claim for $787,987.84 against the Pope Motor Car Co. and Judge Taylor appointed Irvin Belford a commissioner to investigate its validity.

The petitioners allege that they are creditors of the Pope Motor Car Co. in the sum of $240,000, and that Receivers Pope and Yule are endeavoring to smother their claims by presenting a claim of the Pope Manufacturing Co., the parent company, of Hartford, Conn., for $800,000, in which both receivers, it is charged, are personally interested.

It is charged in the petition that the $800,000 claim is irregular. In support of the allegation there is presented a statement of the Toledo concern's earnings for four years

Digitized by Google

from July 31, 1903, to July 31, 1907, which were $1,904,000. This sum was increased by $360,000 earnings from the Indianapolis plant, which is a part of the Pope Motor Car Co. In view of such earnings, the petitioners assert, no claim of $800,000 could be made legally by the Pope Mfg. Co.

That A. L. Pope, together with his father, A. A. Pope, own more than a majority of the stock of the Pope Mfg. Co., on whose books is held the stock of the Toledo concern, is also set forth in the petition. For this reason the creditors demand the removal of the present receivers and the appointment of disinterested persons, although as a matter of fact, it is well known that the men behind the scenes are bent only on securing Pope's scalp; they have no real objection to Yule.

As in the first petition, it is also charged in the one filed on Friday last, that the creditors of the Toledo plant were denied a voice in the selection of receivers and that instances of partial administration justify their petition for new directors of the affairs of the Toledo plant.

The Week's Incorporations.

Wilmington, Del.—J. R. Richardson Auto Co., of Wilmington, under Delaware laws, with $50,000 capital. Corporators not named.

Philadelphia, Pa.—Auburn Motor Car Co., under Delaware laws, with $10,000 capital. Corporators not named.

Seattle, Wash—Sound Motor Co., under Washington laws, with $8,000 capital. Corporators—Walter M. French, E. P. Frin, S. S. Munk.

Binghamton, N. Y.—H. B. Doherty Co., The, under New York laws, with $5,000 capital; to manufacture motors. Corporators not named.

Chicago, Ill.—Pietsch Auto & Marine Co., under Illinois laws, with $30,000 capital; to manufacture and deal in machinery. Corporators—L. W. Pietsch, O. E. Pietsch, C. J. Ward.

Jersey City. N. J.—Maxwell-Briscoe Export Co., The, under New Jersey laws, with $50,000 capital; to manufacture motor vehicles. Corporators—Benjamin Briscoe, J. R. Turner, R. Irwin.

Fort Wayne, Ind.—Black Mfg. Co., The, under Indiana laws, with $10,000 capital; to manufacture and sell automobiles and parts of automobiles. Corporators—Marion Black, A. L. Randall, Edward White, Donald Hayden.

New York City, N. Y.—Radio Battery Co., under New York laws, with $100,000 capital, to manufacture and install batteries, storage batteries, etc. Corporators—R. B. Respess, H. L. Robinson, J. W. Kinne, New York City, N. Y.

Newark, N. J.—Automobile Co. of New Jersey, under New Jersey laws, with $25,000 capital; to engage in the hire and sale of automobiles. Corporators—William V. Morgan and Silas Weston, Montclair, N. J.; Stanford Rogers, Glen Ridge, N. J.

In the Retail World.

E. H. McGibbon has had plans drawn for a large garage to be erected at Venice, Cal. It will be a two-story structure and will cost $7,000.

James A. Quinn, of New York City, has set his bait for the seashore tire trade. He has rented for a term of three years the store at 77 Brighton avenue, West End, N. J., and will open on April 1st.

With G. L. Nickerson, J. S. Brown, and C. W. Sprague as its composition, the Nickerson Automobile Exchange has opened at 309 Fourteenth street, Washington, D. C. The firm will deal in second hand cars.

A. D. Perkins, a former dealer of Los Angeles, has returned to that city after conducting a manufacturing business in Portland, Ore., and has opened at 605-7-9 West Seventh street, as the Perkins Automobile Exchange. He will carry on a trade in second hand cars.

Harry J. Beebe and Charles Haigh, of Alpena, Mich., have formed a partnership and will open a garage in that place. They will do a general repair business and carry a large line of sundries, besides having the agency for several cars.

George E. Hume has been appointed receiver for the Boyd Automobile Co., of Indianapolis, on the petition of the Warner Instrument Co., and other creditors. The company claims to have assets of $7,500 and liabilities of a lesser sum.

Cairo—in Illinois, not Egypt—has a new concern, the National Motor & Supply Co., which will handle the Olds motors and supplies. F. L. Harp, long connected with the Three States Implement & Buggy Co., of that city, is head of the new concern.

The New University Garage, at 166-168 St. John street, New Haven, Conn., has been purchased by Gardner E. Wheeler. This garage is unique in that automobiles are stored in separate "stalls," each provided with private lock and key.

The building on Lake street, Cadillac, Mich, formerly occupied by the Cadillac Machine Co., is being rebuilt for a garage. The name of the company has not been decided upon, but it is stated that it will have the agency for several well known cars. Wynter C. Massey will be in charge of the business.

All the machinery in the Redlands Auto Co.'s garage at Redlands, Cal., has been purchased by Robert Leith and J. C. Duncan, owners of the Casa Loma garage at the same place, and the repair business of the former will be transferred to the latter. J. L. Warner was associated with Leith and Duncan in the purchase.

Suit has been brought against P. F. Ryan of Schenectady, N. Y., to recover the proceeds of a car he sold for Mrs. Ada B. Mills of Lansingburgh. Mrs. Mills was to receive $300 in case Ryan disposed of the car, and anything realized above that amount was to be his commission. It is alleged that Ryan disposed of the car in exchange for another car and $300 cash, but has paid nothing to Mrs. Mills as called for by the agreement.

The Columbus Auto Supply Co., with Cincinnati men as its backers, has been formed in Columbus, and has located at 342 South High street. This makes the first exclusive supply store in Columbus. The men interested in the venture are F. A. Cromley, F. P. Schopper, Jr., G. Schwendler, and W. R. Clark. The first named will manage the business.

W. E. Brown, proprietor of the Tippecanoe Automobile Co., Lafayette, Ind., has disposed of his interests to a company composed of Daniel J. Harrington, Edward J. Gallagher, John F. Ruger and Clarence Brown. The new concern will be known as the Lafayette Automobile Co., and will become incorporated under the laws of Indiana, with $10,000 capital stock.

Several changes will be made along Newark's (N. J.) automobile "row" within the next few weeks. J. W. Mason will remove to his new building on Halsey street, near Marshall, and the present location at 289 Halsey will be occupied by a new firm. The F. E. Boland Co., which, by the way, will change its name, Boland having withdrawn from the company, his interests having been acquired by W. H. Weldon, will occupy a new building at Halsey street and Branford place. It will be a one-story structure, 50x60 feet. The Linkroum Automobile Co., which has been located at 17 Bank street, will occupy the building at 239 Halsey street, which will be vacated by the Boland company. Other changes are in prospect.

Conwell Succeeds to Lull's Position.

J. S. Conwell, who for the past year has been general northern representative for the Auto Vehicle Co. of Los Angeles, manufacturers of the Tourist car, has been appointed general manager of the company, with headquarters in Los Angeles. Conwell takes the place made vacant by the death of Lynn C. Lull, who passed away suddenly in Detroit several weeks ago.

To Manufacture a New Transmission.

The Black Mfg. Co., which has incorporated in Indiana with an authorized capital of $10,000, and is located at Fort Wayne, will make a specialty of a transmission mechanism invented by Marion Black, one of the corporators. In addition, the company may manufacture and deal in automobiles and parts.

New Factory for Laman Tops.

The L. L. Laman Auto Top Co., Utica, N. Y., has moved its factory from 75 Lafayette street to the large building at 179 Blandina street. In its new location the company will have more than 30,000 square feet of floor space, considerably more room than was to be had in the old quarters.

BRISCOE NAMES THE COMMITTEES

Comparatively Few Changes in Personnel of A. M. C. M. A. Management—Smith Again Heads Show Committee.

With comparatively few changes in their makeup, Benjamin Briscoe, chairman of the committee of management of the American Motor Car Manufacturers' Association, has continued all of the committees that served during 1907.

The show committee, which always is an active one, will again have H. O. Smith, president of the Premier Motor Mfg. Co., as its chairman. Associated with him will be S. H. Mora of the Mora Motor Car Co., and R. M. Owen, of the Reo Motor Car Co. The other committees are as follows:

Tours and Races—W. C. Marmon, Nordyke & Marmon Co., chairman; H. O. Smith, Premier Motor Mfg. Co.; A. C. Newby, National Motor Vehicle Co.

Good Roads—Chas. E. Lewis, Jackson Automobile Co., chairman; James Couzens, Ford Motor Co.; R. E. Olds, Reo Motor Car Co.; H. B. Krenning, Dorris Motor Car Co.

Legislation—R. E. Olds, Reo Motor Car Co., chairman; C. G. Stoddard, Dayton Motor Car Co.; A. C. Newby, National Motor Vehicle Co.; R. A. Palmer, Motorcar Co.; R. E. Graham, Acme Motor Car Co.

Membership—W. H. Van Dervoort, Moline Automobile Co., chairman; Morris Grabowsky, Rapid Motor Vehicle Co.; E. K. Burroughs, Abendroth & Root Mfg. Co.

Advertising and Publicity—Barney F. Everitt, Wayne Automobile Co., chairman; Harry Fosdick, Moon Motor Car Co.; G. B. Louderback, Buckeye Mfg. Co.; Theo. P. Bailey, St. Louis Car Co.; Leon Myron Bradley, New York office; Charles E. Duryea, New York office.

Finance—James Couzens, Ford Motor Co., chairman; W. G. Morse, Atlas Motor Car Co.; J. B. Bartholomew, The Bartholomew Co.

Standardization and Technical—John D. Maxwell, Maxwell-Briscoe Motor Co.; Henry Ford, Ford Motor Co.; R. S. Crawford, Crawford Automobile Co.; L. P. Mooers, Moon Motor Car Co.; R. E. Olds, Reo Motor Car Co.

Freight and Transportation—Harry A. Knox, Atlas Motor Car Co., chairman; H. W. Mack, Mack Bros. Motor Car Co.; R. Harry Croninger, Pennsylvania Auto-Motor Co.; J. N. Willys, Overland Auto Co.; G. D. Wilcox, Gearless Transmission Co.; C. C. Hanch, Nordyke & Marmon Co.

Tires—G. V. Rogers, Mitchell Motor Car Co., chairman; James Couzens, Ford Motor Co.; Frank Briscoe, Brush Runabout Co.; O. Stevenson, York Motor Car Co.

Agencies—W. H. Van Dervoort, Moline Automobile Co., chairman; A. R. Welch, Welch Motor Car Co.; H. S. Leyman, De-Luxe Motor Car Co.; Frank L. Pierce, Gaeth Automobile Co.; H. B. Larzelere, Chadwick Engineering Works.

Many Judgments Against Archer & Co.

Three judgments, aggregating $13,742, were entered on Saturday last against Archer & Co., Inc., who formerly did business at 1597 Broadway, New York, in favor of Walter B. Manny, on three notes of the corporation, made on December 27, 1907, payable at the Oriental Bank, which were not paid. The notes were indorsed by Allison M. Archer, president of the company, and the judgments are also against him. The corporation gave up business some time ago. During the past several months the sheriff has received eight executions, aggregating $7,270, against it, but found nothing to levy upon. The corporation was organized about 18 months ago with a capital stock of $10,000, and handled the Hotchkiss car, which agency the Hotchkiss Import Co. recently took over.

Dragon is in the Legal Toils.

On petition of John C. Calhoun, whose claim is for $2,400, money loaned, the Equitable Trust Co. and Samuel C. Myers have been appointed receivers for the Dragon Motor Car Co., Philadelphia, the company assenting to the receivership, but denying insolvency. The J. G. Brill Co., whose former car shops were rented to the Dragon people for a factory, also have made a levy on the company. It appears that even the Dragon Automobile Co., which was the style of the concern before its recent reorganization, had not paid its rent for five mosths.

A. C. A. Opens Supply Store.

The Automobile Club of America has embarked in the supply business, a store having been established on the third floor of the big club house on West Fifty-fourth street, New York, in which a complete stock of tires and accessories will be carried. In the announcement of the opening of the store, members of the club are promised "a large discount from current market prices on all supplies."

Receivers to Continue E. V. Business.

Judge Shumway, sitting in the Superior Court at Hartford, Conn., last week issued an order empowering the receivers, Halsey M. Barrett and Henry W. Nuckols, to continue the business of the Electric Vehicle Co. As compensation for their services, he also authorized the receivers to pay themselves $900 each, on account.

Mansuay Goes from Fisk to White.

Louis M. Mansuay, for the past four years assistant manager of the Fisk Rubber Co.'s New York branch, has resigned that position to take up with the White Co.'s New York store. His change will become effective April 1st.

DURYEA PLANT WAS SOLD TWICE

"Insufficient Funds" Nullifies First Sale and Middleby Then Bids $10,000 Less —Will Operate the Factory.

The real estate and machinery of the bankrupt Duryea Power Co., Reading, Pa., has been sold to Joseph W. Middleby, Jr., for $15,000.

On Tuesday of last week the plant was offered for sale. The bidding was quite spirited between D. Lipman, of New York City, and Mr. Middleby, who is a resident of Malden, Mass. The latter bid up to $25,200, and Mr. Lipman bid to $25,250, the plant being declared sold to him.

When he tendered a check for 10 per cent. of the purchase price, it was ignored at the bank on account of lack of funds, and the trustee again offered the plant for sale on Wednesday morning. Mr. Middleby was the only bidder this time and the trustee declared him the purchaser at his price, $15,000.

Mr. Middleby, it is said, will conduct a new company, and will continue the manufacture of automobiles. Ruring the week 11 automobiles, also several lathes and tools were sold.

The purchasers of the automobiles were as follows: M. M. Thew, New Jersey, $390; Dr. Francis F. Brobst, Reading, $385; Dr. L. H. Moss, Massachusetts, $375; James McClellan, New Jersey, $390; H. W. Limbaugh, Harrisburg, $355; E. L. Sturgis, $350; C. F. Fister, New Jersey, $340; Joseph W. Middleby, Reading, bought four machines for $330, $355, $380 and $250, respectively. The latter is a second class machine.

Charles E. Duryea is preparing to engage in the manufacture of motor buggies. That enduring pioneer long has had unbounded faith in the future of that type of vehicles and proposes to "show his faith by his works."

To Make Buggies in California.

N. M. and Fred Anderson, of Los Angeles, Cal., are making arrangements for the manufacture of motor buggies in that city. They already have built one vehicle, which incorporates several original features, and which was recently put to the test in a long tour through Southern California and Mexico.

Chadwick Completes Move to Pottstown.

The Chadwick Engineering Co. have completed their removal from Philadelphia to Pottstown, Pa. They now are in full possession of the huge new factory which was erected for them at the latter place.

Earl Makes Big Increase of Capital.

The Earl Motor Car Co., Kenosha, Wis., has increased its capital stock to $350,000; previously it was but $25,000.

"Keep Your Eye On Continentals!"

Continental Tires Win Long Island Endurance Contest!

Frayer-Miller Car, Winner of Contest, Equipped with Continental Tires.

A COMPETITOR'S CLAIMS:

Long Island Endurance Contest

Thirteen of the 21 cars used Diamond casings and tubes. Highest competing make equipped 3 cars. Contest won on Diamonds. Plenty of tire trouble all told but not with Diamond tires.

What the Frayer-Miller Company says:

New York, Feb. 26, 1908.

MR. J. B. COTHRAN,
Continental Caoutchouc Co., 43 Warren St., City.

My Dear Mr. Cothran:—

We wish to congratulate you on the way the Continental Tires (with which our car, the winning Frayer-Miller was equipped in the Long Island Automobile Club's Economy Contest) stood up over the 242 miles of this run, under the worst road conditions, the roads being frozen and having deep ruts in them which invited continual danger to our tires.

Our car carried five heavy passengers and we did not have a puncture or a blow-out, and in fact did not touch our tires during the entire run. We did not even think it necessary to carry an extra shoe.

Wishing you continued success, we beg to remain,

Very truly yours,
FRAYER-MILLER COMPANY,
(Signed by) H. H. Knepper, Manager.

VICTORIES FOR CONTINENTAL TIRES

At Ormond, Florida, in March, "Automobile Club of America Cup"; Winning Car "FIAT," Second Car "CHRISTIE," both on Continental Tires. The leading car continued and made a world's long distance racing record, 300 miles, 233 minutes, 44 seconds, 77 miles an hour.

Also, "Minneapolis International World's Championship Trophy," won by the "FIAT" on Continental Tires; and competitive mile record, standing start; amateur mile record; and the world's middle weight mile record, 35 seconds flat.

CONTINENTAL CAOUTCHOUC COMPANY, J. M. GILBERT, Gen. Mgr., **43 Warren St., NEW YORK**

Suggestiveness of the Savannah Race.

The marked success of the big stock car race in Savannah is suggestive of many wholesome truths and points to a more wholesome state of sport. The truths are plain enough and strong enough to make it advisable to toll the knell of the so-called racing car, which is but another term for the "freak" car, which is dangerous to man and beast and of no practical earthly use.

The even, consistent performance of the cars in the Savannah race, the fact that all save one, which had met with an undistressing accident, were in the running at the conclusion of the contest, and that the tires gave a good account of themselves, constitute a bright page in the history of the sport, while the crowd in evidence and the interest created is evidence that "freak" cars are not necessary to arouse and attract the public.

Trophies that serve such useful ends and that promote such sport, achieve more real and lasting and far reaching benefits, serve more practical purposes, and teach more practical lessons, and save more lives than all the Vanderbilt cups which may be offered for the encouragement of "freaks."

The A. A. A. should not permit the lesson to go to waste. Now that it is showing a disposition to give heed to its disinterested supporters and well wishers it should go further in the same direction by adopting a limit for competition that would relegate the "freaks" to where they belong—the scrap heap. And having adopted a limit, the A. A. A. should hold fast to it and not do as was done for one of the races at Savannah, i. e., stretch the limit in order to oblige a splendid gentleman whose car was a trifle over the dimensions originally fixed.

The governing motorcycle organization had dared to adopt a limit and to hold unswervingly to it, and the manufacturers forced to keep within that limit, have done so. It has encouraged practical design, has killed the "freak" and saved the manufacturers themselves no small amount of money. What the motorcycle body has done, the A. A. A. should do, and it can do it if it so wills, and is not thrown off its balance by "too much Vanderbilt cup."

Promoting Utilitarian Uses.

What is reckoned one of the most important uses of the small runabout and light touring car, if not its most important use, is the utilitarian service which it performs for the physician and the business man who is in need of frequent and important journeys over comparatively short distances. The needs of the country doctor, are usually cited as typical in this respect, but they are by no means the only instances in which the requirement is imperative, for transportation such as the light and economical motor car is capable of providing. Obviously, it is to the best interest of both manufacturer and dealer to foster and protect this section of the market, which besides being a voluminous and intelligent one, possesses the desirable feature of absolute and consistent stability.

There can be no question that the manufacturers have done a great deal in catering to this branch of the field, nor that they appreciate its importance. It is open to discussion, however, whether the average agent is exerting himself to his utmost to develop all the business that is latent in this quarter. A successful continuance of the exploitation which already has gained such a good footing depends quite as much upon the wise handling of the repair business as upon the booming of new types or new models of old ones. This consideration demands the attention of the dealer most strongly.

It is essential that the man who uses a motor car because he requires its services rather than because he inclines to it as a pastime, be taught to get the most work out of it with the least possible expenditure of time and money. He must be taught how to keep his car in service all the time; how to have it ready to answer the instant's demand, whether by day or night; and how to reduce his expenses to their lowest terms. This principle may tend to reduce the repairman's income from any one customer. The chances are that it will not work out in that way ultimately, however, since customers who are so treated usually continue as customers to the end of all time, and form the best possible advertisement of which a business can boast.

In this connection, it may be a lesson can be learned from the methods of the watchmaker, who invariably has a watch to lend for every reputable watch brought in for repairs. Carried to extremes, such a practice would be ruinous to the automobile repairer. But in the case of men who must have their cars for daily service, it would be profitable for the repairman to have a substitute machine or two, such as always are to be found about almost any garage, and which could be put into service temporarily pending the release of the owner's machine from the shop. All things considered, the cost of such a policy would be comparatively slight, particularly if the wear and tear of the substitute machine were covered by a nominal rental figure. But even reckoned at a moderate cost to the repairman, the return would be sufficiently great, measured in the confidence and security of the customer's patronage, to well repay the small outlay.

Problem of the Commercial Vehicle.

It is difficult to appreciate the importance of the wise and conservative development of the commercial vehicle for handling heavy loads over long hauls. The utility motor vehicle is slower in coming into its own that the pleasure vehicle has been, though not slower, perhaps, than is to its own best interests. Its leisurely development up to this time, has been sufficiently unspectacular to escape the notice of unscrupulous and shyster promoters, so that

Digitized by Google

it is largely true, that what has been done for the commercial vehicle, has been done earnestly and with the wise purpose of furthering its ultimate growth to the highest possible degree. Yet uninteresting though the type may be, from the standpoint of present worth in the monetary sense, it offers a field for endeavor and a prospect for future usefulness such, that no thinking man in the industry can afford to overlook its specific properties and the difficulties which block its evolution.

One of the most important phases of the problem, and one which is destined beyond a doubt to become a very large factor in its ultimate success, is that of the road train. Primarily, it may be, the idea in itself is unattractive, because it implies a blocking of the highways with huge, slow-moving vehicles, and because the need for it is not apparent. The absolute necessity of transporting large volumes of freight at low costs, however, coupled with the existing limitations to the increase in carrying capacity of the single vehicle, which are daily becoming more apparent, make the road train the only really plausible solution of the problem. What considerations lead to this conclusion, are set forth in another column. Suffice it to say in this connection, that they are sufficient, and that from the results of actual service, it has been proved already, that the road train is not the unmanageable and unprofitable proposition a casual glance at its properties makes it appear.

Briefly recounted, the advantages of the road train are these: The carrying capacity of the train may be largely proportional to the demand of the paying load, since ordinarily, only as many trailers need be used, as are required for the load; the service is more economical in its nature because of the possibility in many cases of working the tractor on practically full time, doubling or trebling the number of trailers, and providing for simultaneous loading and hauling of the full equipment; more economical maintenance, since the disability of one or more trailers need not lay up the entire system; better road service, since the traction is distributed over the whole train—in the more advanced systems—so that a slough of greater length than the train is required in order to mire it; the practical elimination of skidding for the same reason; reduced wear on the road and reduced wheel and driving gear wear, by virtue of load and traction distribution; and the mechanical economy which comes with the concentration of the power plant in the largest possible units.

There are many ways in which regular service for road trains might be established with profit, where the use of individual motor vehicles could not be made to pay. The principle involved is merely that of handling the load on a wholesale basis, and on a large scale, instead of on the retail plan. The man with only enough business to support one truck is not always able to run that on a paying basis, because he cannot afford sufficient "plant" to reduce his maintenance cost. The man or group of men, with sufficient business to support a half dozen trucks, or, what is the same thing, one efficient tractor and four or five trailers, can well afford to pay for the expert attendance, surplus equipment for substitute service, a small repair shop, and repairs.

The profits from railroading are greatest, generally speaking, where the greatest volume of business is handled. Even without actual knowledge in the matter, it would be safe to assume that commercial motor haulage would yield returns somewhat on the same plan. That the bulk of railroad earnings come from freight transportation, suggests an extension of the parallel which is too obvious to be overlooked.

Inconsistency of Frelinghuysen.

Why do not the New Jerseymen who are waging war on Frelinghuysenism touch the author of the jug handled justice, which is implied by that term, on the spot where he is weakest? Senator Frelinghuysen is not a resident of New Jersey. His office and his home both are in New York and long have been. In other words, and in political parlance, Frelinghuysen is, from the New Jersey standpoint, a carpetbagger. As he thus is a non-resident lawmaker, the Jerseymen have additional cause for offense, while New Yorkers also have reason for increased objection that one of their own number should, for political effect, force them to pay tribute to New Jersey while he is free to use their roads without let, hindrance or cost. The wise warriors always seek out the weakest point of their opponents and keep hammering at it. The keynote for the campaign against Frelinghuysenism is plain.

Encouraging the Private Owner.

Suggested in a jocular vein, it is stated that the New Jersey Automobile and Motor Club has given an earnest turn to the suggestion and probably will conduct an endurance contest for private owners only. It is to be hoped that the club will do that very thing. It is to be hoped that every other club promoting a road contest will do likewise, at least to the extent of including a class for private owners in each event. There should be a class of the sort in the Glidden tour. The private owner can be made to give an enduring complexion to such sport—can be made to make it smack more of sport and less of the "trade game." Automobile competition has been so thoroughly saturated with business interests that it is almost waterlogged from the standpoint of sport. No effort has been made to encourage the private owner. It now may prove too late, but on the principle that it is better late than never, it is well worth trying. Up to the present time, the owner has been wet-blanketed.

COMING EVENTS

March 15-April 1, Omaha, Neb.—Omaha Automobile Dealers' Association's annual show in the Auditorium.

March 23-28, Indianapolis, Ind.—Indianapolis Automobile Dealers' Association's show week.

March 31-April 4, Salt Lake City, Utah—Automobile show in Auditorium skating rink.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

April 6, 7 and 8, Denver, Col.—Annual show in Mammoth skating rink.

April 6-11, New York City—New York Automobile Trade Association's carnival week.

April 11, San Francisco—California Automobile Dealers' Association's hill climb.

April 16-18, Memphis, Tenn.—Automobile show promoted by the Automobile Dealers' Association of Memphis, in the Auditorium.

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

May 5-6, Harrisburg, Pa.—Motor Club of Harrisburg's second annual endurance run.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

FRELINGHUYSEN TO CUT THE FEE

New Jersey Senator Abandons His High Tariff — Evidence that He is a "Carpet-bagger."

Senator Frelinghuysen has "come down." As a result of an informal discussion with other New Jersey senators he has advised W. C. Crosby, chairman of the New Jersey Automobile and Motor Club's legislative committee, that "the feeling is that the license fee should be raised to $3 for cars under 10 horsepower, $5 for from 10 to 30 horsepower, and $10 for any above that figure, and the drivers' fee should be raised to $2 and $4, no tourist privilege, the manufacturers' one to five cars at $5 per annum."

"In his new bill Frelinghuysen sought to raise the registration fees on a sliding scale —$3 for cars of 10 horsepower or less, $5 for cars of 20 horsepower or less, and upjumps of $5 for each additional 10 horsepower. At present the fees are $3 for less than 30 horsepower, and $5 for cars of greater power. Frelinghuysen also outlined an increase in the cost of drivers' licenses from $1 and $2, respectively, up to $25. He also proposed to abolish the blanket license for manufacturers and dealers which costs $20. The extent of his "come down" is therefore of considerable magnitude. Mr. Crosby states, however, that the New Jersey automobilists are not satisfied. If any increase whatever is to be made, he thinks an increase of the speed limit or privileges to tourists or non-residents should be accorded in return.

Senator Frelinghuysen's letter to Mr. Crosby advising him of the "feeling" of his fellow senators supplies an interesting sidelight on the manner in which even New Jersey legislators transact their State affairs in New York—and without paying a fee for the privilege. Like Frelinghuysen, Crosby earns his living in New York City. Crosby, however, actually has a home in New Jersey, while the New York telephone directory gives the residential address of Joseph S. Frelinghuysen as 35 West Sixty-eighth street. Inquiry discloses that it is the home of Senator Joseph S. Frelinghuysen—of New Jersey—the same who framed the existing law and who so stoutly insisted and insists that non-residents chiefly New Yorkers, pay an "admission fee' to enter New Jersey. Incidentally New Jerseymen, are accorded non-resident privileges in New York.' For political purposes, Frelinghuysen has a letterhead which bears "Raritan, N. J." as his address. His letter to Mr. Crosby ostensibly was written and dated from that point, but for once the crafty senator missed his cue. The letter was addressed to Crosby at "755 Water street, City." If anyone asked for Water street in Raritan, N. J., he probably would cause the oldest inhabitant to scratch his head until he was freed of even suspicion of hayseed. For Water street is in New York City.

In political circles the man who resides in one State and holds political office in another State is termed a "carpet-bagger."

Asks Congress for Motor Volunteers.

The Automobile Club of Maryland is anxious not only that its own State but the Federal government recognize the automobile as an instrument for fight as already it is generally recognized as a vehicle for frolic. To that end Delegate Carr has introduced a joint recolution in the Maryland legislature calling upon Congress of the United States to adopt measures for the promotion of the use of automobiles in warfare. It was referred to the committee on Federal Relations. Later Mr. Carr offered a bill designed to permit the organization of a volunteer motor corps as a part of the State militia. In pursuance of the plan Representative Talbot of Maryland, on Monday last, offered in the House the petition from the Automobile Club of Maryland for the passage of an act by Congress creating a body to be known as "the volunteer motor corps" throughout the country as part of the regularly organized militia of the several States.

Canadian Compounds a Queer Bill.

If the bill just introduced into the Canadian parliament by Mr. Bowman should by any chance become a law, the use of automobiles will become a delightful pastime. The measure provides that no motor vehicle shall be allowed to run or stand upon any public highway in any municipality, excepting in a city, between 7 in the morning and 9 o'clock in the evening of Saturdays, and between 7 in the morning and 3 in the afternoon of Sundays. It also seeks to require that persons having control of motor vehicles when meeting a horse outside city or town limits are to stop at least 100 yards distant, and shall not proceed or allow the motor to operate until the horse or horses are safely passed.

Three More Clubs in New York.

The Peekskill Automobile Club and the Automobile Club of Ulster Co. have joined the New York State Automobile Association, making 43 clubs now on the roll. The Automobile Club of Mount Vernon, which was organized on Thursday last with William Adams as president, and F. A. Kately, secretary, also will affiliate with the A. A. A. State organization.

Can't Bar Child Drivers in Florida.

Judge Call, sitting in the Circuit Court of Florida, has declared "unreasonable and void" that part of the Jacksonville ordinance which prohibited children under 16 years from driving automobiles. The point was raised on an appeal in the case of Jack McMillan, who was convicted in a lower court.

STANDING START FOR HILL CLIMB

Plans Revised for the Fort George Contest of Carnival Week—Eleven Events on the Schedule.

Following a meeting of the hill climbing committee, Colonel K. C. Pardee, the chairman, announced a rearrangement of the classification and conditions of the Fort George hill climb to be held in conjunction with the New York Automobile Trade Carnival during the week of April 6. The climb will take place on Thursday afternoon, April 9th.

The contest will be open to stock cars under the price classification schedule of the A. A. A., and for the first time the climb will be from a standing start, in order to eliminate any possible chance of an accident such as took place at the last climb, when a car struck the subway pillar which occupies a part of the roadway near the foot of the grade and leaves but a narrow opening.

Blanks can be obtained from and entries will close with Colonel K. C. Pardee, No. 317 West Fifty-ninth street, on Monday April 6. The entry fee in each event will be $10, or for non-subscribers to the carnival fund, $110. Following is a list of the events:

1. Gasolene cars selling for $850 or less. 2. Gasolene cars selling from $850 to and including $1,250. 3. Gasolene cars selling from $1,251 to and including $2,000. 4. All gasolene cars selling from $2,000 to and including $3,000. 5. Either steam, gasolene or electric cars selling from $2,001 to $3,000. 6. Gasolene cars selling from $3,001 to and including $4,000. 7. Gasolene four-cylinder cars selling for over $4,000. 8. Six-cylinder cars, selling for over $4,000. 9. Free-for-all, cars of all motive power. 10. Steam cars only. 11. Electrics of all types.

Native Cubans Try Road Racing.

Native Cubans, negroes and resident Havanians witnessed some exciting races at the Cuban capital on Thursday last, 19th inst. The race for runabouts from 25 to 50 horsepower, was won by Aspuro, who drove a Winton over the course, 2,610 metres (1. 2 miles) in 2:11⅗. Damasco Laine finished first in the event for cars under 25 horsepower, his time being 2:33, while Mario Carvajal was the victor in the class for cars up to 50 horsepower. Time, 2:00⅗. Honore Laine finished first in the class for touring cars between 25 and 50 horsepower, his time being 2:21. Antony Colas won a similar event for professionals in 2:15. The Havana cup was won by Alfara and the Lucha award was won by de Bustamante, who made the best time over the kilometre. Each competing car was fully equipped and carried its full complement of passengers. The events aroused considerable interest.

SAVANNAH SETS NEW STANDARD FOR SPORT

Big Race For Stock Cars Proves That Freaks Are Not Necessary For Success—Strang Scores a Notable Victory But Consistent Performance Is The Rule—Governor Hoke Smith Presents The Victor—Every Detail Well Executed.

1. ONE OF THE DIAMOND TIRE CAMPS.
2. LYTLE ROUNDING THE ISLE OF HOPE TURN.
3. GUARDING THE COURSE.
4. McCULLOGH AFTER BEING DITCHED.

The balance turned at Savannah, Ga., on Thursday last, 19th inst., the second day of the two days' road race carnival for stock cars, under the auspices of the Savannah Automobile Club. The "big" race very much more than redeemed the partial fiascos of the day before.

Despite a disappointing first day, when two 180 miles races were held, in one of which but two cars finished and in the other one car, the second day brought out the first long distance road race for stock chassis held in America, and produced the finest sport ever witnessed in a long distance road race in this country. It was distinctly Vanderbiltian and a little bit more.

In a few seconds more than a quarter of a chronological day Lewis Strang jumped from the minor position of an understudy to the exalted position of one of the best race drivers in the country, by piloting a 50 horsepower Italian Isotta-Fraschini car over 20 laps of the 17.1 miles level oiled course in the fast time of 6 hours 21 minutes 30 seconds. Strang has for several years been a mechanic for and once-in-a-great-while substitute for Walter Christie. The total distance was 342 miles, making his speed average 53.83 miles an hour.

A few minutes behind Strang finished Herbert H. Lytle, well known as a Vanberbilt cup race driver, in a 50 horsepower Apperson car. Lytle's time was 6:44:37,

Digitized by Google

and Malcolm Newstetter, a hitherto unknown, in a six-cylinder Acme car, finished a close third in 6:47:05. Two minutes after him came H. A. Michener, in a Lozier car, and Al Poole, known as Joe Tracy's mechanic, driving a counterpart of the winning car, was fifth. Poole made the fastest lap of the race, covering the second in 15 minutes 53 seconds, a speed better than a mile a minute. When the race officially was declared over two cars still were in the running—the Stearns, driven by Frank Leland, and the American, piloted by Fred Tone. Only one of the eight cars was put out of the running and that through no fault of its mechanism, but through an error of judgment on the part of the driver who attempted to take a dangerous turn too fast and who overturned in consequence.

The feature of the race was the remarkably consistent performance of all the competing stock cars, and the service given by the tires. The Isotta-Fraschini was fitted with Michelin and the Apperson with Diamond tires, and on neither car was it necessary to replace a tire throughout the race, something unprecedented in long distance events.

The arrangements were perfect and enthusiasm bubbled over in true Southern fashion. While it is impossible to accurately estimate the crowds that saw the race, a fair guess numbers the attendance at 50,000. The crowd was most dense, of course, at the grandstand, where 5,000 persons sat for six hours in a broiling sun, while the parking spaces held automobiles filled with persons in holiday attire. Both sides of the road were lined with spectators, two and three deep, while the Thunderbolt and the Isle of Hope turns held great crowds. Despite the crowds, not an accident happened to one of the spectators, due to the excellent military patrol in command of Major W. B. Stevens. The service of the military organizations, performed willingly without compensation, reflects the whole spirit of Savannah in regard to the meet. Seven hours' patrol duty with loaded rifles was a fatiguing task. The presence of the soldiers and naval reserves had its effect in preserving order and keeping the course clear. Only one incident is recorded where individuals attempted to cross the course in violation of orders from the patrol guards, and after one shot had been fired over the heads of the three men who disregarded the warning, and another bullet ploughed up the sand in front of them, the men quickly halted and were placed under arrest.

The course presented an animated appearance, and the presence of the picturesque Diamond tire camps around the circuit, and the directing banners indicating the turns and angles, gave it the aspect of a Vanderbilt cup course. The city of Savannah was deserted while the race was in progress. Practically all the business houses and even the schools had closed, and the only people left in town were the negro porters and bell boys in the insufficient number of hotels, a few policemen, firemen and street car conductors. Every other Savannahian was somewhere on the course.

Although Georgia is a prohibition State it did not follow that all of the spectators went dry. Most of the hampers carried in the automobiles contained "ginger ale," which is known in Georgia as "prohibition beer," or something stronger, while it is even recorded that several automobiles carried on a thriving trade as itinerant bars. The presence of Governor Hoke Smith, Mayor Tiedeman of Savannah, and other State and municipal dignitaries did not apparently curtail the brisk trade.

ONE OF THE SUPPLY STATIONS

Three hours before the race started the crowd began to fill grandstand, parking places and other points of vantage and when Lytle, in the Apperson, got the word at 10 o'clock, the grandstand occupants rose to their feet and gave him a cheer. Lytle got away without incident and was soon lost to sight up the oiled White Bluff road. Ninety seconds later Strang, in the Italian car, took the signal, and the others got away at the same intervals. Fred Tone, in the American, was third, and Michener, in the gray painted Lozier, which had been dubbed King Cotton, breasted the tape next. Clad entirely in white, while from the tops of their tightly fitting headgear defiantly floated white streamers, Michener and his mecanicien presented a striking picture as they awaited the signal. The "King Cotton" lost several seconds at the tape. William McCullogh, in the ill-fated Apperson was fifth away, and then followed Al Poole, in the other Italian car; Poole was the favorite. Frank Leland, driving the Stearns car, the only machine entered by a Savannahian, was seventh, and Newstetter, the dark horse, in the Acme "six" started last.

The first news received by telephone at the stand came a few minutes after Newstetter left. It was to the effect that the American car had shed a tire on the first turn. Strang passed Lytle on the first lap and led at the end of the first 17.2 miles, covered in 17 minutes 50 seconds, with Lytle second in 18:35. The second round passed with Strang still in the lead and opening a gap on Lytle, while Poole, Strang's team mate, simply burned up the roads and almost overhauled McCullogh, who had left before him. Poole's fast driving in this lap scored for him the fastest lap in the race, the 17.1 miles circuit being covered in 15:53.

It was in the third lap that McCullogh came to grief. He attempted to pass Poole on the sharp left handed turn after leaving the Isle of Hope, and took it too fast. Neither the driver nor Wray, his mechanic, was injured when the car overturned, but the steering wheel was broken, and that put it out of the running, although later a temporary repair was made and the car returned to Savannah under its own power.

Poole had hard luck. After being in the lead for a part of the time and holding second place from the tenth to the fourteenth laps, he was compelled to drop back to fifth position on account of tire and other troubles. Lytle also had some trouble with a broken oil pipe. He dropped from second position to fifth and it was not until after the tenth lap that he got actually in the running again. When he did, Lytle made the most remarkable run of the race. Hard luck spoiled the chances of the American and the Stearns cars early in the race. The former cast a shoe after being in the race less than six minutes. Another followed at the Isle of Hope and a third at the turn into the homestretch in the next round. An oil flooded clutch also added to Tone's discomfiture, while Leland was beset by a series of mishaps. He drove by the stand twice with one tire missing, and in the seventh lap ran through a barbed wire fence. He lost much valuable time each lap in plugging up the leak in the radiator caused by the sharp barbs.

The run of Michener's Lozier for the first eight laps is worthy of note, as it reeled off lap after lap with a maximum variation of only 19 seconds, while two circuits, the third and fourth laps, were made in exactly the same time to the second. The performance was again repeated in the 12th and 13th laps.

r 15 laps was 6:36:30, and Leland's 6:45:24.

Trailed by the Lozier and by his own team mate, Strang began to pull away and kept his lead through the seventh lap, only to drop it to Michener in the next. In the 9th lap, however, Strang made a fast spurt and again regained the lead, which he retained from then until the finish.

At the end of the 10th lap, with the race half over, Strang led Poole by 7 minutes, with Michener three minutes behind. Newstetter was fourth, Lytle fifth and Leland sixth. Tone was last. It was at this point that Lytle began his remarkable run that landed him ultimately in second place. With the exception of the 16th lap not one of the succeeding rounds was covered in more than twenty minutes. Poole had carburetter trouble in the 11th lap. In the 18th lap Strang came up to Poole and seeing him under the machine, slowed up to ask the trouble.

"Never mind me," yelled Poole. "Go on; you've got the race won!"

While Poole dropped back Lytle climbed steadily forward. His heady driving in the closing laps of the race manifested itself to the spectators. In the 15th lap he passed Tone after an exciting brush past the grandstand which brought the crowd to its feet, and a few minutes later overhauled Poole. The crowd in the stands got another thrill in the 17th lap when Lytle passed Poole after a neck and neck dash past the tape.

When it became known that Strang practically had won the race he slowed down in the last three laps. On the last lap he came down the homestretch between two lines of cheers, smiling and with one hand in the air. Lytle followed and was greeted even more tumultuously than was Strang. The most spectacular finish was made by Newstetter in the Acme, when he dashed down the last stretch at a speed of 75 miles an hour, after a great run in which he snatched third place from Michener. After Poole had finished, the race was declared over.

Possibly it was the proudest moment in Lewis Strang's life when, after winning the race and a leg on the $3,000 challenge trophy that went with the victory, Governor Hoke Smith presented him and his mechanic to the grandstand audience. After complimenting the management of the race and commenting upon the great sport the Governor said:

"While it was a foreign car that won this race it had to be driven by an American citizen to win. We appreciate superb machinery, but we place manhood first of all." Strang smiled when the Governor presented him as the "hero of the day," and seemed more pleased when the Governor himself pinned upon his coat a gold medal at the veritable love feast which followed in the evening.

At the shore dinner given by the local club in the evening a lot was said about Savannah's chance for landing the next Vanderbilt cup race, and even Jefferson De Mont Thompson, chairman of the cup commission, who refereed, said that next to his own State (New York) he was in favor of Savannah. Medals also were presented to Lytle, who won the runabout race on Wednesday in an Apperson car and to Salzman (Thomas-Detroit) the only finisher in the stock car race, on Wednesday. The supper was the occasion for felicitation on all sides, and the guests passed a resolution thanking the American Automobile Association for its service, the manufacturers, photographers, newspaper men and everybody else. The only dry feature of the supper was that the menu "suffered" considerably on account of Georgia being a prohibition State. Even this harshness was softened somewhat by referring to cocktails as "your choice of soft drinks," and substituting "prohibition beer" (ginger ale) instead of wine, while rye (bread) and soda (crackers) took the place of the genuine articles. "Black coffee for sobering" and "Sham pain on Ice (water), topped off the menu, with a satirical "Too bad—isn't it," as a final flourish.

Although no official figures have yet been given out, it is thought that the two days' meet will be an "even break," so far as finances are concerned. Including the building of the big grandstand, parking stalls, fences, and so forth, and oiling the race course, the meet cost the Savannah executive committee approximately $15,000. It is thought that the receipts will about meet this expense.

GOV. HOKE SMITH DELIVERING HIS ADDRESS; STRANG ON HIS RIGHT

CANADA FLOCKS TO TORONTO SHOW

Many Cars Staged and Leading American Makers Among the Exhibitors—Railroads Display Active Interest.

With a total of 66 exhibitors, more than half of whom display cars, Canada's annual automobile, motor boat and sportsmen's show opened in the St. Lawrence arena, Toronto, Saturday night last, 21st inst. This year's exhibition is attracting more notice than former shows as the various railroads are taking an active interest to the extent of exhibiting and offering single rates from all parts of Ontario to Toronto. Because of the railroad excursion rates many visitors from outside points have been attracted to the show, more than five hundred certificates having been presented for redemption the first day. The show is held under the auspices of the Ontario Motor League, which has a membership upwards of 400. Among the exhibitors are:

Ford Motor Co., Automobile & Supply Co., Dominion Automobile Co., Oldsmobile Co. of Canada, Canada Cycle & Motor Co., Hyslop Bros., Ltd., McLaughlin Motor Car Co., George N. Pierce & Co., Packard Motor Car Co., Maxwell-Briscoe Motor Co., Cadillac Motor Car Co., Mitchell Motor Car Co., Stevens-Duryea Co., Dayton Motor Car Co., Darracq Motor Co., Studebaker Bros. Co. of New York, Renault Freres, Napier S. F. Edge, Ltd., Ferro Machine & Foundry Co., S. F. Bowser & Co., Diamond Rubber Co., Dunlop Tire & Rubber Goods Co., Canadian Puncture Proof Tire Co., George A. Haw, Premier Motor Co., Randall-Faichney Co., Auto Igniter Co., Roberts Motor Co., International Carriage Co., Motz Tire Co., Reo Motor Car Co., Comet Motor Car Co., Winton Motor Carriage Co., Kissel Motor Car Co., Premier Motor Mfg. Co., and Royal Motor Car Co.

Debut of Native Car at Omaha.

The third annual show of the Omaha Automobile Association, held in the Auditorium, Omaha, Thursday, Friday and Saturday last, 19th, 20th and 21st insts., brought out one new car, the only one manufactured in Nebraska. The Fuller, as it is called, is a four-cylinder water cooled machine, employing friction transmission and shaft drive, and is made by the Angus Automobile Co. of Angus, Neb. The other cars on exhibition are: Franklin, Pilain, Delahaye, Moline, Columbus, Buick, Reo, Holsman, Oldsmobile, Maxwell, Stanley, Stevens-Duryea, Babcock Oakland White, Stoddard-Dayton, Ford, Pope-Hartford and Jackson.

Fresno "Society" at Dealers' Show.

For a town with so few dealers and by the same token a limited number of agencies, the first show held by the six dealers of Fresno, Cal., March 12, 13 and 14, was an ambitious effort. In all there are eight dealers in the inland town, but as only members of the newly organized Fresno Automobile Dealers' Association were allowed to exhibit, the show was limited to six exhibitors of cars. The opening night was termed "Society Night," when the dealers charged one dollar admission and 'got away with it," too. The cars shonw were: White, Maxwell, Oldsmobile, Buick, Pierce-Arrow, Tourist, Mitchell, Elmore, Locomobile, Ford, Reo, Rambler.

New Haven Show Well Attended.

Despite stormy weather the annual show of the New Haven (Conn.) Automobile Dealers' Association opened in Music Hall that city Wednesday night last, 18th inst., with a large crowd in attendance. The show continued all week, one day's receipts being given to the poor of the city. The hall was tastefully decorated with flags, bunting and potted plants, more than 150 of the last named being distributed about the room. Neither the Maxwell nor the Stoddard-Dayton cars were shown, as Harry B. Tuttle, the local agent, could not secure sufficient space. In consequence he rented two stores on the main floor of a building a few doors west of Music Hall where he held open house all week. The cars shown in Music Hall were: Locomobile, Apperson, Clement-Bayard, Pope-Waverly, Franklin, Stevens-Duryea, Buick, Babcock, Studebaker, Cadillac, Oldsmobile, Reo, White, Corbin, Thomas, Atlas Compound Schact and Pope-Toledo.

Utica Man Wins Franklin's Prize.

The solid gold 21 jewel watch offered by the H. H. Franklin Mfg. Co., as a prize for the Franklin agent who submitted the best ten reasons why an automobile buyer should select the Franklin, has just been awarded to Irving R. Gardinier, superintendent of the automobile department of C. H. Child & Co., Utica, N. Y.

The contest lasted for four weeks, 57 contestants taking part. Their ten reasons varied in length from 10 words to 2,500 words. All were carefully examined by a committee consisting of H. H. Franklin, president of the company; John Wilkinson, chief engineer, and F. R. Bump, sales manager.

Thomas on Taxicab Mission to Pacific.

E. L. Thomas, of the E. R. Thomas Motor Co., is on the Pacific coast chiefly on taxicab business. It is stated that he had organized a cab service in San Francisco and that a similar project is under way in Los Angeles.

Automobile Show for Salt Lake City.

Salt Lake City is to have an automobile show in Auditorium roller skating rink in that city. It will open on March 31 and continue through the week, closing April 4.

WALKER WESTON AT ROCHESTER

Aged Pedestrian an Exhibit of Great Interest at Local Show—The Cars that Were in Evidence.

With Edward Payson Weston, the venerable pedestrian, who surprised the world by walking from Boston to Chicago some time ago in record-breaking time, is the feature exhibit the Rochester Automobile Club held its first annual show in Convention Hall, Rochester, N. Y., Wednesday, Thursday, Friday and Saturday of last week, March 18th to 25th inclusive. None of the crudity usually attendant to first attempts was manifested at the Rochester club's exhibition. The electrical display was well worked out. Because of the limited floor area the placing of the exhibits on the ground floor necessitated a systematic arrangement. In the center of the hall was a large rectangle, with an aisle for spectators around each of its four sides, and another bisecting it at right angles. Through the center of the rectangle was a line of white Corinthian columns with an arch surmounting the dividing aisle. Each of the columns had at its top a cluster of electric bulbs, while wires of suspended bulbs ran diagonally from the center to the corners. Green and white, the club's colors, were displayed lavishly, but in pleasing harmony. Weston, the pedestrian, was the feature of the Gearless exhibit, a car of this make having accompanied him on a part of his long march to Chicago last year. Among the cars displayed were the following:

Gearless, Thomas Flyer, Thomas-Detroit, Columbia, Elmore, Packard, Jackson, Mitchell, Maxwell, Stoddard-Dayton, Pierce-Arrow, Stevens-Duryea, Locomobile, Selden, Pope-Waverly, National, Earl, Jewel, Buick, Peerless, Corbin, Aerocar, American, R. & L., Lambert, and Holsman.

Another Car for Street Cleaners.

The Department of Street Cleaning of New York has obtained permission from the Board of Aldermen to purchase, without public letting, an automobile to cost not over $3,500. Last December, Dr. Bensel, at that time street cleaning commissioner, notified the sinking fund commissioners that the department had more automobiles that were required for its needs; the result was that a Lozier touring car was transferred from the street cleaning to the health department. Now, however, that the snow has gone and the pleasant days and evenings of summer are approaching, the need of another car is sadly felt, so the Lozier company have been directed to furnish another of their touring cars. The car to be furnished has been carefully and particularly selected, and according to some reports is likely to prove an object of considerable interest.

AMERICAN ENTRY REACHES 'FRISCO

Thomas Car Completes First Leg of New York-Paris "Race" in 42 Days—Foreign Contenders Still Tinkering.

With Harold Brinker at the wheel, the Thomas car, the only American entry in the New York-Paris "race," rolled into San Francisco on Tuesday last, 24th inst., and it is expected that it will be shipped by boat to Alaska to-morrow or the next day. The voyage across the American continent had occupied 42 days. The "race" started from New York, February 12, and while it has proven rather amusing as a race, it has been a strenuous struggle that has tested both men and machines. Of the six starters, two quit—the Sizarre-Naudin, which lasted only 96 miles, and the Motobloc, which was entrained at Omaha.

An accident, variously reported as affecting the differential, the steering gear and the driving gear, had delayed the Thomas at Stone Cabin, between Ely and Goldfield, Neb., on Thursday. Extra parts had to be brought out from Tonopah, 57 miles distant, and the incident delayed Goldfield's celebration of the arrival of the only American contestant. By Saturday, Beatty, Nev., was reached, when, instead of taking the proposed route over the Santa Fe and San Pedro lines, Brinker followed the shorter and more mountainous route to Mojave, Cal., and so to Bakersfield, which was reached after forced runs, day and night, on Sunday. Fresno was left behind on Monday, and the 100 mile run into San Francisco accomplished the following day without incident.

A mud hole west of Church Bluffs, Wy., held the Zust car in its clutches all of Thursday night, and until a Union Pacific work train had been side tracked on Friday, long enough for its crew to lend sufficient tackle and brawn to extricate it. The total delay amounted to some 40 hours. Immediately afterward, the party experienced a bitter disappointment in the refusal of the railroad officials to grant the Italians the use of the Aspen tunnel, and the right of way over the Piedmont Mountains, which has been permitted the Thomas. An attempt was made to construe this into an affair of international importance. But upon the explanation of the officials that the passage of the American car had so cut up the ballast that it had been necessary to go over it completely in order to put the road into serviceable condition once more, the matter was allowed to pass under protest. The services of the obliging railroad company were again called into requisition on Monday, however, when, only a few miles beyond Kelton, Utah, the car came to grief, and returned to face a long delay. In this emergency, a special train was supplied to take the car back to Ogden, where the U. P. shops were thrown open to it for the third time. It was re-shipped to Kelton, and again took the road Wednesday afternoon.

Undergoing the usual difficulties, the De Dion car got as far as Rock Springs, Wyo., on Monday, and there became mired outside the town. In warping it out of its berth, something went wrong with the tackle, and St. Chaffrey's right hand was injured. Press despatches under his own signature later stated that the hurt was so great as to impair his driving ability, and that he would probably be forced to give over the management of the expedition to Autran, so soon as San Francisco is reached.

Thursday of last week, the Protos car came near overtaking the De Dion at Lexington, Neb., which was reached only about four hours after the departure of the French entry. A delay pending the arrival of some much-needed tires, which had been sent to Seattle for Alaskan duty, but re-requisitioned for service in the States, however, spoiled the Franco-German speed contest which had been anticipated. Laramie, Wyo., was reached on Sunday evening after a strenuous run of 57 miles. The car is now reported to be within 100 miles of the De Dion, at Green River, Wyo.

THOMAS CAR WITH BRINKER AT WHEEL, BUMPING OVER THE TIES IN UTAH

Clubs Choose New Officers.

The following officers were elected at the annual meeting of the Norristown (Pa.) Automobile Club: President, John E. Mountain; vice-president, B. Frank Stritzinger; secretary, Edwin S. Nice; treasurer, Louis E. Taubel; directors, F. M. Jacquith, R. A. Jackson, Harry A. Wlison, and F. B. Wildman.

Dr. S. T. Davis was re-elected president of the Lancaster (Pa.) Automobile Club at the annual meeting last wek. The other officers elected were: Vice-president, Martin Kinports, Ephrata; treasurer, Dr. P. P. Breneman, Lancaster; secretary, J. D. Rider, Lancaster; directors, H. M. Hillegas, Columbia; Dr. J. F. Trexler, Lancaster, and H. C. Shock, Mount Joy.

The Automobile Club of Cincinnati has elected the following officers for the ensuing year; President, Dr. C. L. Bonifield; first vice-president, C. Gordon Neff; second Jr., C. E. Bultman, Paul Cerkamp, Dr. A. Dr. L. S. Colter; treasurer, Harry L. Manss; consulting engineer, E. J. Carpenter; board of governors, G. W. Drach, Val Dittenhofer, Jr., C. E. Bultman, Paul Verkamp, Dr. A. B. Heyl and Louis Merkle. The club has a membership of 242.

Will Again Climb Sport Hill.

The Automobile Club of Bridgeport, Conn., will, as usual, hold its annual hill climbing contest on Memorial Day. This announcement was made last week after a conference with the selectmen of Easton, who agreed to allow the club the use of Sport Hill at that place on the morning of May 30th. Rules and classes will be announced later.

KING CARNIVAL AT INDIANAPOLIS

Dealers Hold Open House for the Week—Exciting Hill Climb Held and Big Parade to Come.

Indianapolis's seventeen agencies and nine manufacturers are this week holding an open house show or "spring opening," as they term it. The carnival week should have opened on Monday, 23d inst., with a decorated parade, but because the weather forecaster prophesied rain it was postponed until Wednesday, though not until 50,000 persons had congregated in the downtown district to witness the spectacle. The services of the weather forecaster will be dispensed with in the future because it did not rain. All the agencies along Indianapolis's "row" are tastefully decorated.

The feature on Tuesday was a big hill climb held up the sharp incline known as Michigan hill, northwest of the city. Thousands of spectators lined the course, which is exactly four-tenths of a mile long, and some exciting sport was their reward. Howard Hodson, driving a Stoddard-Dayton car won three of the five events, and in the class for cars listing between $2,750 and $3,500, made the fastest time of the day, 37⅘ seconds. C. P. Brockaway, driving an Overland, a locally-made car, was the victor in the class between $1,000 and $1,800, and W. B. Peterson, Buick, made the fastest time in the event for cars listing under $1,000. The feature was the small difference in times made by all the competing cars in each event, as shown in the following summaries:

Cars listing at $1,000 and under—Won by W. B. Peterson, Buick, 0:48⅗; second, Frank Menthorn, Ford, 0:56; third, O. G. Mayers, Reo, 1:03⅕; fourth, Bert Corbet, Maxwell, 1:03⅗; fifth, D. B. Sullivan, Lambert, 1:24⅕.

Cars listing from $1,000 to $1,800—Won by C. P. Brockaway, Overland, 0:50⅗; second, Guy Simonds, Stoddard-Dayton, 0:51⅖; third, Harry Knight, Buick, 0:55; fourth, C. E. Gibson, Ford, 0:56; fifth, W. W. Beeson, Auburn, and O. G. Mayers, Reo, tied in 0:57⅕; sixth Adams, Great Western, 0:58; seventh, Ferguson, Buick, 0:58⅕; eighth, P. L. Crighton, Great Western, 1:01⅗; ninth, F. M. Martindale, Leader, 1:06⅕; tenth, J. W. Lambert, Lambert, 1:10⅕.

Cars listing from $1,000 to $2,750—Won by H. Hodson, Stoddard-Dayton, 0:38⅘; second, L. E. Finch, Thomas, 0:40⅘; third, L. Markle, Oldsmobile, 0:44⅘; fourth, Frank Nutt, Haynes, 0:45⅖; fifth, Harry Knight, Buick, 0:46⅖; sixth, Frank Nutt, Haynes, 0:47⅖; seventh, A. W. Moore, Premier, 0:48⅖; eighth, F. Eisle, Oldsmobile, 0:51⅗; ninth, Miloch, Cadillac, 0:54⅘; tenth, H. S. Wilcox, Autocar, 0:55; eleventh, R. L. Sutherland, Cylde, 0:58⅗.

Cars listing from $2.750 to $3,500—Won by Howard Hodson, Stoddard-Dayton, 0:37⅖; second, L. E. Finch, Thomas, 0:40⅘; and Harry Hammond, Premier, tied; third, L. Markle, Oldsmobile, 0:40; fourth, Ray Tinkle, Marmon, 0:47; fifth, C. W. Enzland, Marmon, 0:48⅘; sixth, H. S. Wilcox, Autocar, 0:52⅖.

Cars listing at $3,500 and over—Won by H. Hodson, Stoddard-Dayton, 0:39; second, Thomas Kincaid, National, 0:39⅖; third, L. E. Finch, Thomas, 0:41⅘; fourth, J. Aitken; National, 0:42; fifth, Frank Clements, National, 0:44; sixth, G. W. Enzland, Marmon, 0:47⅖.

Motoring Sensations in Fiction.

There is a vast difference in point of view, both optical and mental, between the corner seat in the tonneau and the post of honor and responsibility behind the steering column. That is why the motorist is so frequently separated from his guest by a great wall of fear, which, in a measure, is only a barrier of experience. Difficult as it may be for the passenger to realize that his dread of some dire calamity is but a condition of mind, however, it is even more difficult for the driver to appreciate the attitude which induces this condition in one who is not accustomed to the sensations of motoring at high speed.

In "My Enemy the Motor," published by John Lane Co., New York, Julian Street presents the sensations of a direct drive initiation into an automobile existance most vividly. That the picture is humorous as well, is to be expected in the nature of things. It is a tale of a proposed tour in southern Europe, which Fate intervened to prevent. Not much as a tale, perhaps, but more as a picture, and very good as a study in mental attitude. The characterizations are terse and pointed; the descriptions take a firm hold on the nervous system of even the hardened driver; and the narrative moves as rapidly to its climax as does the exploit which it relates. The fact that it once appeared in magazine form does not detract from its amusing and entertaining quality, which makes up in tone for what the book lacks in number of words.

Milwaukee Referee Upholds a Protest.

The protest of the Cleveland Motor Car Co. against the penalization of 2680 points charged against the Continental-tired Cleveland in the Milwaukee three days reliability contest has been allowed by the referee. This decision reduces the penalty to 1430 points, and gives the car first place in Class A, for cars selling for $3,000 and over. The protest arose over a difference in the time consumed in replacing a broken front spring.

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

OLD BUCKMOBILE CASE REVIVED

Seaton Secures Affirmation of His Judgment Against the Late Dr. Brower—Echo of a Memorable Run.

Like an echo out of a long forgotten past was the decision handed down by the Appellate Division of the Supreme Court in Rochester, N. Y., in the case of Albert J. Seaton, respondent, versus Abram G. Brower, appellant. The decision was an order denying the motion to strike out interest reversed without costs. The judgment was modified by striking therefrom the amount of interest allowed, and as so modified affirmed, together with the new order denying motion for new trial, without costs of the appeal to either party.

The case was one which aroused considerable interest at the time of trial, as it had some bearing on the workings of the old Buckmobile Co. The first trial was held before County Judge Pritchard and a jury and was opened April 22d, 1907. Two days were consumed in the trial. The case was given to the jury, which returned a sealed verdict, awarding the plaintiff $1,000.

In opening the case it was shown that Brower was president of the Buckmobile Co., and afterwards, in April, 1904, when it was taken over by the now defunct Black Diamond Automobile company, a larger corporation, he also became president of that company. The case hinged on the memorable run from New York to St. Louis.

Seaton, then in the employ of the automobile company, was chosen to pilot a car in the run, but he at first refused to go as the Black Diamond company owed him a considerable sum of money. The evidence showed that Brower prevailed upon Seaton to make the run, pointing out that a successful journey would mean much to the company, as it would enable it to sell its stock more readily. Seaton claimed he was promised $1,000 to make the trip.

When the plaintiff rested, the lawyer for the defense said that Seaton had invented the buckmobile, "an outlandish looking machine on a buckboard," organized a company and got Brower and another into it. After speaking of the merger with the Black Diamond company the lawyer for the defense characterized Seaton as an "auto crank who would not have missed the St. Louis run for all the stock in both companies."

The evidence was very contradictory. Judge Pritchard, in charging the jury said the only thing for them to determine was whether Dr. Brower agreed to pay Seaton $1,000 for making the trip. There was no question as to the amount and the verdict should be either no cause for action or $1,000 for the plaintiff, and the latter alternative was taken by the jury.

Since the trial Dr. Brower died, and the claim is now against the estate.

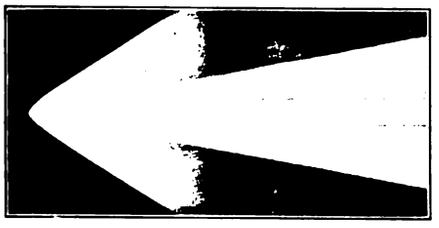
BESNARD SYSTEM IN SOLAR LAMPS

Details of the Method for Eclipsing Headlight Glare—Division of the Rays into Two Groups.

Of the several ways by which it is possible to check the illumination of the acetylene headlight in order to prevent the unpleasant and even dangerous effects of its blinding glare upon opposing traffic, the most simple and obvious possess the disadvantage of temporarily impairing the usefulness of the lamp. In the Besnard system, the American rights to which recently



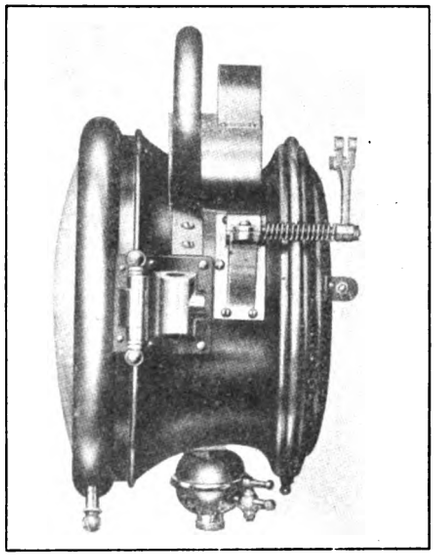


Fig. 1

were secured by the Badger Brass Mfg. Co., Kenosha, Wis., and applied in somewhat modified form to the Autoclipse and Solarclipse lamps, this advantage is developed, that the throttling of the penetrating and dazzling beam of light which is reckoned the undesirable feature of all lamps of the plain searchlight type, does not in the least affect the illuminating power of the lamp within the restricted field immediately in front of the car. The very evident advantage is that the driver of the car, while enabled to protect other users of the road from the confusing effects of the long distance rays of light, is still enabled to guide his car intelligently, since the road immediately before him is brilliantly illuminated.

In order to accomplish this very desirable effect, the light thrown from the lamp, instead of being concentrated in a single beam, focused for either very long or very short projection, is divided into two independent beams. The first is intended solely for illuminating the immediate foreground, and is a wide-angle distribution of a portion of the light emanating from the flame. The second comprises a highly concentrated beam, thrown directly through the other and projected to a great distance for

THE SOLARCLIPSE LAMP

the purpose of illuminating the road at a considerable distance from the car. The effect is thus practically that of two lamps, one for long distance and the other for short distance illumination. The way in which the light is distributed is made clear by the Solar people in their catalog just issued, which renders possible a better understanding of the Besnard system.

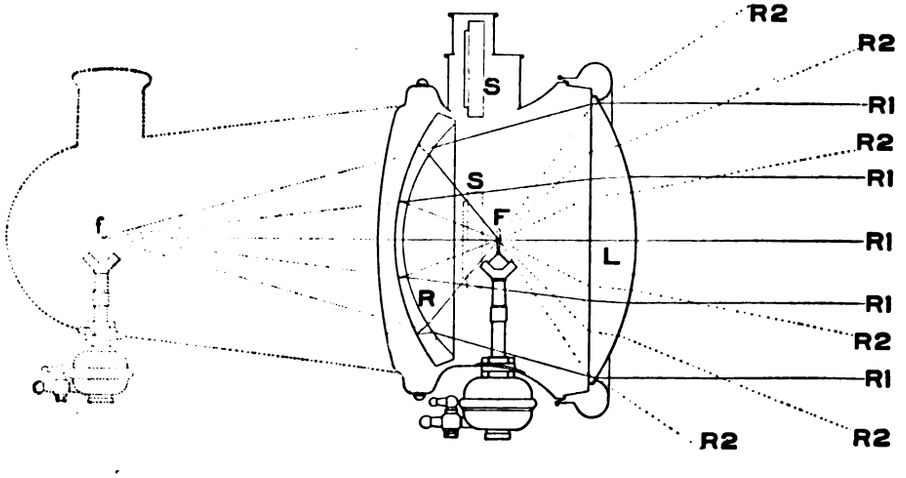

Fig. 2

The manner in which the light is distributed is shown by Fig. 1. In Fig. 2 the principle of the system is illustrated. The rays emanating from the front of the flame, F, are caught by the plano-convex lens, L, and distributed over the wide field directly before the car, as shown by the rays, R2, but without developing any of the blinding effect which is the unpleasant feature of the average searchlight. These rays are permanent, and constitute the broad and mild beam shown in Fig. 1. The rays from the back side of the flame, F, are reflected from the hyperbolic mirror, R, back to the lens to form the concentrated long-distance beam of light, R1, shown in the center of Fig. 1, as covering the wheel tracks indicated by the two parallel lines in the center of the picture.

Without the special combination of hyperbolic reflector and lens which is known technically as a "hyperlenticular" combina-

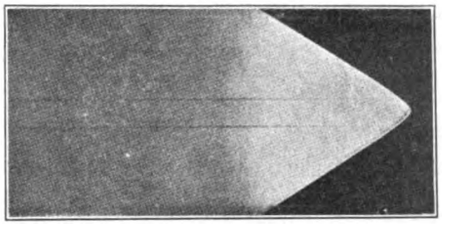

Fig. 3

tion, a much greater depth of lamp would be required in order to secure an adequate focal distance between flame and lens. How long a lamp would otherwise be required to secure the same projection of the long distance beam, is shown in Fig. 2, by the dotted lines and the indicated position of the equivalent flame at f.

The difference between the Autoclipse and Solarclipse lamps develops in connection with the reflection and refraction of the long distance beam, as it has been called. In the Autoclipse lamps, the French method of construction is employed, the reflector, R, comprising merely a shallow metalic mirror, which is purely a reflector. In the Solarclipse lamps, on the other hand, a special form of lens mirror reflector is employed which performs the double function of reflection and refraction, thereby devel-

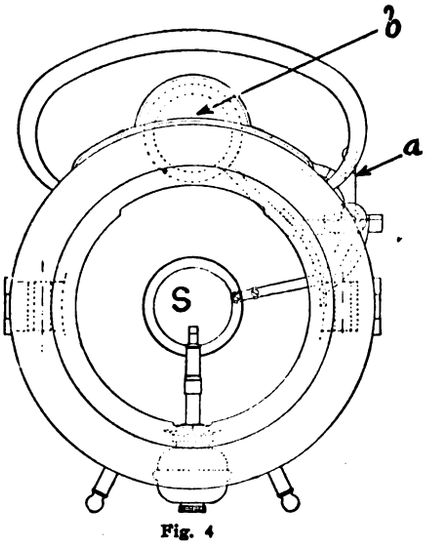

Fig. 4

Digitized by Google

oping a higher degree of efficiency in handling the light, and also possessing certain mechanical advantages not to be found in the plain reflector, such as the very important non-corrosive property of the lens mirror.

Once the method of distributing the light is understood, the way in which the eclipsing of the long distance rays is brought about is easy to comprehend. All that is required is to interpose an opaque shutter between the back side of the flame and the mirror in order to eliminate the rays which are, for the moment, undesirable. To this end, the small shutter, S, Fig. 2, is brought down from its normal position in the heat hood to the position shown by the dotted lines. The resulting effect is shown in Fig. 3, where the light from the front of the flame only, is seen to be distributed through a very wide range, but with sufficient diffusion to dispel any blinding glare. The power of the flame, so employed, is sufficient to illuminate the road distinctly to a distance of 35 yards from the lamp, giving a clear view of the road, sufficient for running at low and moderate speeds with perfect safety. With the shutter raised to its normal position, on the other hand, the central beam is carried to a distance of 320 yards, developing the bright, white spot in the road, which is essential for ordinary running at night.

The mechinical construction of the lamp is further brought out by the front view shown in Fig. 4, in which the eclipsing effect is shown where the shutter is dropped into the position shown at S. Ordinarily, a spring suffices to hold it in the position, b, in the heat hood, from which it is displaced when desired, by means of the small lever, a, which is worked by a Bowden wire from the driver's seat. By a special method of connection, both headlights are manipulated by a single control wire, and in unison. The arrangement of the external lever and spring are shown in the side view of the complete lamp, which also emphasizes the compact construction which is brought about through the use of the hyperbolic mirror.

Little Clips that Require Care.

It is essential that the little clips which are so frequently employed to bind together the outer leaves of the ordinary elliptical springs, be held firmly in position, and that in the event of their being broken or lost, they be replaced immediately. If this is not done, the stress, when the spring is subjected to a heavy rebounding action, is brought almost wholly on the inside leaf, and unless more than strong enough for its ordinary work, there is great danger of its being broken.

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

EASING THE CLUTCH ENGAGEMENT

Application of Suction Dashpot for Checking Motion—Progressive Action in Picking up the Load.

While there are certain drawbacks to every form of friction clutch which has yet been put upon the market, or used in connection with the motor car transmission, it is undoubtedly the case that the moving cause in nearly all improvements which

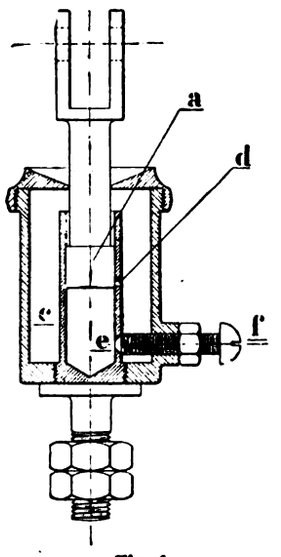

Fig. 1

have been made, as well as in the development of the newer types which have in some measure replaced the old leather-faced cone type, has been the difficulty of obtaining a smooth engagement when picking up the load from rest. Skilful drivers never have

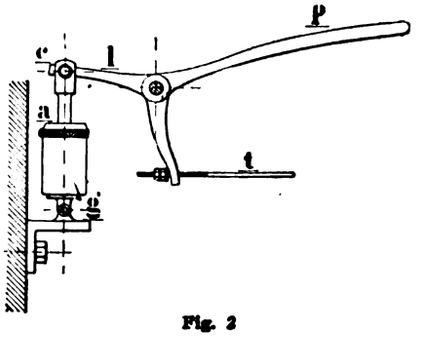

Fig. 2

been wont to complain of the performance of the cone clutch in this respect, nor have they habitually failed to obtain good running results with it. Hence it would appear that in many respects, some device calculated to ensure the same method of engagement as is used by the skilled driver as a result of this training, would go a long way toward solving the problem of successful clutching of the load, regardless of the type of clutch employed.

One of the most obvious expedients which could possibly be employed in this connection is the use of the plain suction dashpot for checking the motion of engagement, and ensuring its progression at a stated rate. Such a system has been developed recently by the firm of Outhenin Chalandre, Neuilly-sur-Seine, France. It comprises nothing more nor less than a small attachment which may be connected to almost any form of clutch, and which serves merely to check the rate of engagement according to the adjustment of the escape valve upon which its action depends.

As shown sectionally in the accompanying Fig. 1, it will be seen that the device consists principally of a small cup or shell, fitted with a screw top and containing a small cylinder mounted centrally within it in such a way as to leave an annular space within the outer shell. The plunger, a, is connected by means of the clevis on its stem with some movable portion of the clutch actuating mechanism, while the shell is attached permanently to the frame of the car. A small orifice part way up in the side of the inner cylinder, shown at d, permits a certain amount of the fluid contained in the device to circulate as the plunger moves up and down, until the latter closes the opening. Thereafter the flow between the cylinder and the outer space, c, must take place through the small hole, e, which is regulated in area by means of the screw, f, and its lock nut.

Attached to a clutch of the familiar Panhard type, the arrangement is as shown in Fig. 2, P, being the piano-type of pedal, t, the actuating arm connected to the drag rod which disengages the clutch, and l, the braking arm, to which the shock absorber, or clutch regulator, a, is attached by means of its plunger, at e. The shell of the device, g, is mounted on the dashboard of the car, as shown, and is articulated to provide for a certain amount of radial movement.

When the clutch is to be engaged, instead of releasing the pedal gradually, as must be done ordinarily, the operator merely lifts his toe entirely clear of the pedal, when the spring is permitted to draw in the clutch until the small orifice in the cylinder of the device has been passed by the plunger, when the resistance to its motion becomes sufficiently great to slow it down to the desired rate. Thereafter, the engagement proceeds at a controlled speed and is rapid or slow, according to the adjustment of the regulating screw. The action is precisely the same as is employed in the ordinary form of hydraulic door check. The acceleration of the car is thus regulated to a uniform degree, and all starting jolts and shocks eliminated.

To Guard Against Short Circuits.

The length of a battery's life depends on how much current is taken from it. A short-circuit will quickly kill even a new cell. It is important, therefore, that in connecting up batteries or in putting them on a machine, care be taken not to let any metal parts touch the binding posts of the cells.

COMMERCIAL VEHICLE PROBLEMS

Limitation of Permissible Axle Load—How Met in Four Wheel Drive and Multiple Unit Trains.

What is admittedly the principal limitation of the commercial motor vehicle results from the double consideration of the unsatisfactory state of the tire problem, and the inability of the average highway to withstand the concentrated pressure of very heavy loads. Thoroughly successful commercial vehicle design, therefore, must be carried out with definite regard to a certain limiting permissible axle load. How this factor affects the transportation of very heavy loads, and how it is likely to work out in the development of motor haulage on a large scale, is considered by Joseph A. Anglada in a paper read before the Society of Automobile Engineers.

"Within the past few years it has been proven by users in general that, aside from the advertising value of commercial automobiles, which exists in few cases at present, the employment of auto-trucks of over 6,000 pounds load capacity is not as profitable as the employment of smaller vehicles," remarks the authority in question. "The rapid depreciation of the rubber tires in general use, and of the power generating apparatus, necessitating frequent repairs and replacements, are the chief reasons for the above state of affairs.

"A few vehicle manufacturers and users have attempted to solve the problem of expensive tire renewals by the use of various types of wooden and combination tires, and the use of resilient wheels. However, considering that by far the greater number of commercial automobiles of all types are still using and being equipped with rubber tires of the same general type used for the past eight or ten years, it seems that solid rubber tires, expensive as they are in all respects when used on large vehicles, are at present the most satisfactory solution of the problem. . . . .

"Another objection to the use of large trucks is their inability to exert sufficient tractive effort under all conditions of loading and road surface. As a remedy, some manufacturers furnish sand boxes for delivering sand under the driving wheels, as in railroad practice, while others endeavor to overcome this difficulty by driving all four wheels. The first method is an unsatisfactory makeshift, while the latter necessitates expensive complication of the propelling and steering mechanisms, with the extra weight of these parts assisting depreciation.

"The six-wheel vehicle is a step in the right direction, but the complication inseparable from this arrangement and the expense of building and maintaining this complicated construction detracts seriously from the attractiveness of the six-wheel proposition. Unless at least four wheels are driven, the traction disadvantages of the two-wheel drive are always present. When four or six wheels are driven the objections stated above also count against this system.

"The system employing a tractor and trailers is used abroad to some extent, and has the advantage of distributing the load on a number of wheels. But the objectionable feature of having but one pair of driving wheels counts against the system; because, unless the driving wheels are provided with cleats to assist propulsion, it is impossible to haul a paying load at all times, and even with cleats the above is not possible if the road has deep sand or mud upon it. The use of cleats is objectionable because they cause the load on the driving wheels to be concentrated on comparatively small areas of the road surface, causing it to deteriorate rapidly.

"Col. Renard realized the shortcomings of the above system when he developed the road train system which bears his name. It consists of a train of vehicles, the leading vehicle having mounted upon it the power-generating, speed-controlling and steering apparatus. A shaft arranged with the proper number of universal and slip joints extends throughout the length of the train and transmits the power of propulsion to the driving wheels of each vehicle. Thus it is possible to carry a large and therefore a well paying load without having excessively large individual vehicles, causing rapid depreciation of same due to the inability of providing resilient tires or wheels or springs for carrying heavy loads. The road surface is also protected, because the unit load on same is reduced, the weight being distributed on a greater number of wheels and therefore on a greater area of road surface. In addition, rubber tires are not necessary because sufficient tractive effort is obtained by the increased number of propelling members. Steel tires may be used on the trailing vehicles because there is no mechanism except the comparatively simple propelling and steering apparatus mounted on them, and on the leading or power-furnishing vehicle rubber tires are allowable."

It seems to the writer, after studying the Renard system, that its advantages may be retained and the complication of the power transmitting and controlling apparatus reduced and these parts made more efficient by the use of a modified system. This, he describes as follows:

"The leading vehicle has mounted upon it the steering and control apparatus, a source of motive power, storage battery, steam or internal combustion motor, but preferably the latter, on account of its simplicity and small weight per horsepower. The motor is coupled to an electric generator which furnishes current to a pair of electric motors on each vehicle. The vehicles are connected by means of a bar which transmits the steering effort from the drawhead at the rear of the leading vehicle to the front axle of each following vehicle. The length of this bar and the position of the front axle are so determined in reference to the rear axle of the leading vehicle, that the entire train follows the same course when turning. The vehicles are also connected by flexible electric conductors, arranged so as to be readily connected or disconnected when it is desired to place a vehicle in or out of the train.

"Three methods of control suggest themselves: First, the ordinary method of operating the internal combustion motor at a constant speed to obtain a constant voltage at the generator, and then, by means of a series paralleling controller, connecting the fields and armatures of the motors in various combinations, virtually as done in street car and electric train service. Second, a method in which by varying the speed of the generator its voltage is varied correspondingly, causing a proportional current to flow through the motors, making their speed and torque vary. Third, a method whereby varying the voltage of the generator, by changing its field excitation, its speed meanwhile remaining constant, causes an effect similar to that of the foregoing method. It would probably be found advisable to obtain the field current for the generator from an exciter mounted on the end of the main generator shaft, to save weight, and having its output controlled by the driver of the train.

"With the two latter methods, it would also be found advisable to provide a switch for connecting the two motors on each vehicle in series combination for climbing grades and for starting when the train was fully loaded. This switch could also be used for reversing the direction of rotation of the vehicle motors.

"The generator should be designed to furnish a direct current at 220 volts and the windings should be so arranged that when the output of the generator nearly equaled the output of the gas motor, the voltage of the generator would decrease and thus decrease the current flowing to the vehicle motors. This feature, while not absolutely necessary, is desirable because at no time is it possible to overload and stall the gas motor by careless operating. For instance, consider that the motors of the train, which are 220-volt direct current series motors, are operating in multiple combination, and that the train approaches a grade which requires more power than the gas motor can furnish to the motors in multiple combination. The generator voltage would decrease and thus prevent the vehicle motors and the gas motor from being overloaded, and if the driver should persist in not operating the switch to connect the vehicle motors in series combination, the train would come to a standstill if the power required was greatly in excess of what the gas motor can supply."

The chief source of difficulty with the average vehicle of current design, is the battery, as he further points out. The motor, and in the case of the gasolene-elec-

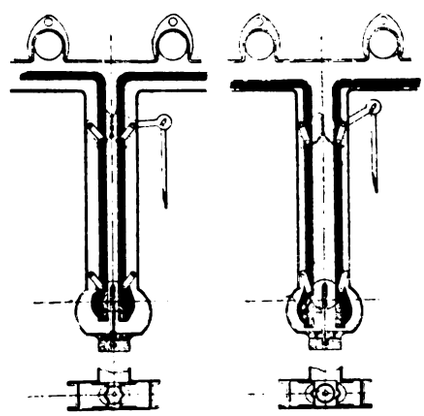
Digitized by Google

tric unit, the generator as well, are above suspicion, so that the only probable sources of trouble in a system of the sort in question, would be the controller and the conductors carrying the current to the various units. Such a train, in his opinion, would not weigh more than a train equipped with an entirely mechanical transmission, would not cost as much to build, and would operate more efficiently, and at a lower maintenance cost.

"In this country multiple unit road trains have been constructed by the Gibbs Engineering and Manufacturing Co., and Alden Sampson," he continues. "The first Gibbs train consisted of a power wagon and two trail wagons. . . . . The power wagon has mounted upon it a three-cylinder gasolene engine direct connected to a generator furnishing power to motors driving the rear wheels of all the vehicles. The leading vehicle is equipped with solid rubber tires and the trailers have iron tires. The speed of the train was regulated by a two-motor street car type controller so modified that by operating the drum intended for reversing the car motors, the vehicle motors, which were regular series wound electric vehicle motors, would be connected in series or multiple combination. . . . . .

"The second Gibbs train consists of a power wagon and four trailers. The power wagon has mounted upon it two three-cylinder gasolene engines driving a double commutator generator through positive clutches on the engine shafts and Morse chains. The rear wheels of all of the vehicles are driven by series motors through gearing and roller chains."

The road wheels, in particular, he calls attention to, which, he says, "are steel discs flanged at the outer circumference. The discs are riveted to bronze bushed steel hubs and steel tires eight inches broad. Speed regulation is obtained by means of a controller similar to the one used on the first train, with the exception that the controller drum generally used for reversing the car motors is in this case used to connect the two windings on the armature of the generator in series or parallel. . . . .



"This train was used to transport machinery and supplies from a railroad to a mine in Arizona. The route is 115 miles each way and leads through a desert and mountainous country.

"The Alden Sampson train, which was exhibited at the last Madison Square Garden show, consists of a power wagon and two trailers, the former carrying a four-cylinder gasolene motor, driving a dynamo by a silent chain. The power plant, which occupies the forward part of the vehicle, is mounted on a separate spring suspended frame, while the rear part is arranged for carrying a load. All the vehicles are of the six-wheel type, the large center wheels being independently driven on all of the vehicles. . . . . The trailers are double-ended, so that they may be operated in either direction."

ORIGINALITY IN INDUCTION PIPE

Its Modification of Throttling Action—Features Reducing Sectional Area Through Its Entire Length.

Among other confusing notions which a close study of the carburetter problem breeds, is the idea that the usual methods of throttling by restricting the area of the delivery pipe, cutting down the cross section of the gas flow at one point only, gives it opportunity to expand after passing the valve, thereby robbing it of some of its heat, and tending to cause condensation, with consequent upsetting of uniformity and general reduction in the value of the gas from the standpoint of its combustible quality. On this account, the poor running

of many motors when throttled is accounted for in a comparatively simple manner.

To overcome this difficulty, an English inventer, W. Gillett, whose Gillett-Lehman carburetter already has been described in these columns, has developed a new form of induction pipe in which the throttling action instead of being confined to the valve alone, as is ordinarily the case, has the effect of reducing the sectional area of the induction pipe throughout its whole length, thus ensuring uniform velocity in the gas for the entire distance it must travel after leaving the mixing chamber, preventing any tendency to pocketing, eliminating re-condensation, and securing permanence in the gas to a degree which is impossible of attainment with the ordinary arrangement.

As shown in the accompanying illustration, the induction pipe, at the base of which the fuel jet is located much in the ordinary way, instead of being the usual simple conduit, comprises an outer casing, within which are mounted a couple of moveable vanes running its whole length and coupled together by means of an external mechanism in such a way that the movement of a suitable lever causes them to move toward one another or apart, as the case may be, thus varying the area of the passage. Instead of being round or oval, the outer casing is rectangular in section, and the moveable vanes fit its sides tightly, so that the space enclosed between them must at all times form the conductor for the gas. When open to their full capacity, the area is nearly the same as that of the outer casing itself, but when closed, as for running under throttle, the area is considerably reduced, the upper curved portions of the vanes also rising as well as approaching one another in such a way as to reduce the working area of the intake manifold as well as the induction pipe itself.

The idea is distinctly a novel one, and though introducing an amount of complication which a year or two ago would have been thought absolutely unjustifiable by the requirements of the case, is sufficiently in line with present theories to ensure careful consideration for it. There can be no doubt that re-condensation does occur in the average manifold and to an unpleasant degree at times. Whether it is only to be overcome by some mechanical means such as this, or whether it may be obviated by some more subtle method, remains to be seen.

One Rule Without an Exception.

A rule to which there should be no exception is: "Never start the engine when the car is standing over gasolene." Frequently when filling the gasolene tank some of the fuel finds its way to the ground, either from overfilling or because of carelessness in pouring into the filler hole or funnel. To start the engine over this overflow is to invite serious trouble for it is often that sparks are discharged from the muffler when the engine races and this is especially true if the muffler contains much soot. Occasionally a leak in the gasolene pipe or tank, or maybe a carburetter float chamber in which the seat of the needle valve needs grinding, will permit of the gasolene forming in a puddle when the car is standing on the street. It is important to stop such leaks and it is better to keep the car in motion than to stand over exposed gasolene, which a match, carelessly thrown in the street, may ignite.

Precautions in Removing the Magneto.

It is so easy to remove the average, modern, high tension magneto, and the temptation is so great to dismount it whenever the least excuse presents itself, that the usual caution as to observing its timing before doing so, cannot be repeated too often. All that is necessary is to see that the driving gears are properly "spotted," and that the marks are sufficiently intelligible so that on putting the device back into place it will be possible to mesh the gears exactly as they were in the first place. A very small slip in this respect may be sufficient to upset the running of the motor and necessitate the complete re-timing of its ignition system, especially when the operator is not sufficiently well acquainted with the properties of the magneto to be able to locate the trouble at once and remedy it correctly.

PORTABLE SUBSTITUTE FOR A PIT

Easy and Inexpensive to Construct—May also be so Made as to Serve as a Turn Table.

No matter how accessible the parts of an automobile may be, the necessity for getting under it arises sooner or later, than which nothing in connection with the repair of a car, is more disagreeable.

While a pit offers the simplest solution of the difficulty it is not always practical for the private garage; and the small repairman frequently has not the facilities for this adjunct to his repair plant. It is, however, a comparatively easy matter to construct a device that will give the opportunities for working beneath the car without entailing the expense incident to the construction of a pit. One of the sort is shown by the accompanying illustration.

SUBSTITUTE FOR PIT AND TURNTABLE

First get two pieces of channel iron several inches wide, and of sufficient length to be two or three feet in excess of the wheel base of the car. Mount these on timbers or castings that are twelve or fourteen inches high and have an inclined approach to each channel. Place these two channels so that the distance between them is the same as the tread of the car, and then run the latter up either under its own power or by using jacks. The space that is thus gained beneath the car will be found to be sufficient to enable the repair man to work under it at great advantage. If the two structures are tied together in some manner and castors put under them, the whole will serve admirably as a turn-table or portable stand.

Uses of the Emergency Brake.

The emergency brake, as the name implies, is a brake for use in tight places where something more than the foot brake becomes necessary. But the emergency brake has other uses than that of the sudden stopping of the car.

When descending a long hill, especially if the grade is steep, the continued use of the foot brake causing an intense heating of it, and if the construction is such that a lining is employed in the brake shoe, it will be quickly destroyed by the continued friction. To prevent this destruction, which entails some expense and considerable labor in replacing the lining, it is well to alternate in the use of the brakes on steep descents. By setting the emergency in a position where it will permit of the car attaining only the desired momentum and releasing it after a short distance has been traveled, substituting for it the foot brake, and in turn releasing that before it becomes heated, both brakes are kept cool and the wear on each is reduced to the minimum, as the real destruction comes from heat rather than from service without heat. On hills that are long it is a good plan to cut off the spark and have the momentum of the car turn the engine over a few times in this way cleaning out the cylinders and cooling them. If this is done it is desirable to use caution in starting up the power, as a sudden jerk will occur unless the speed of the car is in accord with the speed of the engine.

Warming a Car with Exhaust.

The use of hot air from the exhaust to heat a motor car for winter touring is the novel scheme of J. D. Turner, a Franklin owner of Grand Forks, N. D. Mr. Turner recently made a 700 mile trip in a Franklin runabout from Grand Forks to Quincy, Ill., in the midst of a real western blizzard, but with his new heating apparatus and a closed canvas top he and his companion went through the zero weather in comfort.

The method of heating consisted of placing on the floor of the car a coil of pipes connected directly with the "main exhaust." The "main exhaust" of the Franklin carries off only about 30 per cent. of the burnt gases, and its temperature was just about right to heat the car comfortably. The remainder of the exploded gases in the Franklin passes out through the auxiliary exhaust, which opens at the lower end of the cylinder.

Causes and Effects of Overheating.

Running with too rich a mixture, too late a spark or too much throttle opening all tend to cause the same difficulty—overheating. The result in either case, must be a slow explosion, which results in a high cylinder temperature throughout the whole of the working stroke, instead of only during the first part of it, and a high exhaust temperature and pressure. The result is that the lubricant is burned from the cylinder walls before it has time to perform its proper function; that the surface of the exhaust valve becomes pitted; and that the engine tends to overheat.

DRESSING FOR LEATHER TOPS

Formulas for Preparations Adapted to Old or New Material—Improving Wear as Well as Appearance.

The competent chauffeur is one who in addition to his ability to drive the car, assumes a personal interest in its upkeep and appearance. The power plant, while it may be his chief concern, is not the only part that receives his attention, for the body and accessories require some care, and if a casual observer sees evidence of these minor parts having received it, it safely may be concluded that the entire equipment is receiving adequate care.

One of the problems that are presented to the man, whether chauffeur or owner, who desires to give proper care to every part of the car, is the method of preserving a leather top. As long exposure to the air will cause the leather to become dry, unless it receives a proper dressing, it naturally follows that in this condition cracks will occur when the top is folded—as it generally is—and when the cracks appear the surface is, of course, lost. For the treatment of leather which has begun to "go bad," a good mixture is the following:

To one pint of neatsfoot oil add a quarter of a pound of beef suet, completely melted so that no lumps remain; stir the mass thoroughly before adding a tablespoon full of melted beeswax; shake in a closed dish or can sufficiently to insure a perfect mixture, and then add one ounce of ivory black, and again shake thoroughly. Rub this on the top with soft cloths, taking care to rub the mixture well into the leather; the effect will be to cool the top and impart to it a redeeming elasticity.

In cases where the top has suffered greatly from wear or harsh treatment, it is well to obtain a first class top dressing which can be purchased ready for use or prepared in the following manner:

One pint of liquid asphaltum, one pint elastic finishing varnish, one pint of boiled linseed oil, one-half pint japan, a pint of turpentine; add to this one pound of ivory black and mix thoroughly. Use freely and rub in well.

To Start Magneto from the Seat.

Starting the motor from the seat when high tension magneto ignition is employed, has been considered, if not impossible, at least so difficult as to be hardly worth considering as a possibility. In a recent foreign invention in this line, however, just this feature is made possible by the adoption of a ratchet driving gear for the magneto armature, whereby it may be rotated by hand to obtain the first one or two "shots," the gear afterward picking up the shaft at the proper point in the cycle to insure correct firing sequence.

LAW TO PERMIT HILL CLIMBING

Massachusetts Senate Reports Favorably on Bill to Authorize the Closing of Roads for Contests.

There is now a probability that the Worcester Automobile Club will hold another climbing contest on Dead Horse Hill during next summer. The committee on roads and bridges, of the Massachusetts Senate has reported favorably on a bill providing that local authorities may grant permits to persons to drive automobiles and motorcycles in hill climbing contests during specified times on specified parts of the highway at any rate of speed. The bill is practically the same as section 9 of chapter 52 of the Revised Statutes, which authorizes the mayors of cities and selectmen of towns to close public roads temporarily for bicycle races.

The senate committee gave a hearing on this bill on Friday, 6th inst., when the Worcester Automobile Club, which had asked for such legislation, was represented by Daniel F. Gay and others. Mr. Gay told the committee that the road on Dead Horse Hill is an abandoned one on the Boston and Hartford turnpike which has been fixed up by the club at an expense of about $1,500 for the purpose of automobile hill climbing. It is no longer a public thoroughfare between any particular towns, and was little used before the Worcester Automobile Club repaired it.

On two occasions the club arranged climbing contests, the last being two years ago, when approximately 10,000 people assembled. Sixty patrolmen were engaged to keep the street clear, but it was found that they had no authority. All they could do was to suggest to the spectators that they "kindly step back" to make room for the automobiles to come up. No body of men has the authority to close a highway for an automobile contest. Hence the club asks fhat the Legislature confer upon the mayor and board of aldermen of a city and the selectmen of a town authority to give special permits for special occasions to close the streets during a specified time, and upon a specified stretch of road. It was the purpose of the Worcester Automobile Club to make the law general so that any city or town might benefit from it, though the club has no other direct interest in it than to secure conditions of safety for its own contests on Dead Horse Hill. If the bill is rejected there will be no contest, otherwise the club may arrange one for this year.

Start of a Four Years' World Tour.

One of the most extensive automobile tours of the world was begun last week when Mr. and Mrs. H. A. Hover left Los Angeles in a Maxwell car for a four years' tour of the world. Starting from Los Angeles they will go south across the line into Mexico, returning to Los Angeles by a different route. Going north, they will follow the coast road to San Francisco and from there will go on to Portland and Spokane, via Seattle. The next jaunt will be eastward, through Idaho, Montana and the Dakotas, turning north to Winnipeg into Canada. Hover says he will be the first to drive an automobile from Winnipeg to Toronto. From Toronto they will go to Chicago, by way of Buffalo, turning back to New York. From New York the car will be shipped to Naples. The first winter the Hovers expect to cover the Riviera thoroughly and will go into Algeria and the Nile region. The summer will be spent in Northern Europe, touring in England, Scotland, Ireland, and Sweden. By the winter of 1910 the Hovers expect to have seen most of Europe and will then go on to India, and from there to China, Japan and the Philippines. The trip is being made purely for pleasure and Hover states that he will travel five years if four is not enough to see all the places of interest in the world.

Minneapolis to Revise Ordinances.

All automobile ordinances now in force in Minneapolis are to be repealed and a new ordinance is to be adopted. This move results from representations made to the city council through Attorney Will, representing the Minneapolis Automobile Club, that a new ordinance recently adopted is not consistent with former ordinances passed. It has been decided to increase the price for tags from 50 cents to $1, on the ground that a tag that would be acceptable to owners of fine cars cannot be furnished for less. The Minneapolis Automobile Club is to furnish a draft of the proposed new ordinance.

Cab Driver's Costly Carelessness.

Reckless taxicab drivers would do well to remember the fate of the Parisian driver who ran into and killed a professor. The chauffeur was not the worst sufferer for he was sentenced to only three months' imprisonment, but the company figuratively got the axe. It was made to pay damages of $10,000 to the victim's widow, together with $5,000 to an unmarried daughter and $1,400 to each of four other children.

Bar Harbor Again Bars Automobiles.

Bar Harbor (Mount Desert Island, Maine) will remain closed to the automobile for another season. At the town meeting held last week in the town of Eden, of which Bar Harbor is a part, the citizens voted on the proposition to permit automobiles to be run on what is known as Bay View drive, which was defeated by a vote of 415 against 174.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

BIG REGISTRATION FOLLOWS SHOW

Sudden Increase in Demand for Massachusetts Licenses—Statistics of the State's Income from Motorists.

There has been a notable increase in the number of automobiles registered in Massachusetts within the past three weeks, which by some people is attributed largely to the influence of the recent show in Boston. E. J. O'Hara, who has charge of the automobile department of the State highway commission, states that the week before the show 314 automobiles were registered; during show week the number went up to 438; and last week the figures climbed toward 600. Motorcycle registration also took a jump. Sixteen new dealers were registered while the show was in progress, and eight others have taken out certificates since its close.

Since the first of January, when the law required that all motor vehicles be re-registered, the highway commission has issued about 6,900 certificates for automobiles, 300 for motorcycles and 275 for dealers. The demand for private operators' licenses has hardly begun and only 346 new licenses of this sort have been issued. The number of professional chauffeurs, however, is growing rapidly and it begins to look as if the demand for operators for hire would be more than supplied. Since the beginning of the year 231 new chauffeurs' licenses have been issued and 460 have been renewed. Up to the middle of the month, when the figures from the automobile department were last tabulated, the commission had taken in more than $40,000 from this department. Of this amount over $38,000 was for registration of cars and under $2,000 for licenses. The commission is preparing for a heavy rush during the next six weeks.

No Dinky Runabouts for Police Head.

When Superintendent of Police Regan, of Buffalo, heard that the Board of Aldermen is in favor of buying a $900 car for him he laughed.

"Think of me riding in one of those dinky little runabouts," he is quoted as saying, as he threw out his chest and contemplated his stature. "Why, I would have to let my feet hang over the dashboard. Huh, $900 wouldn't buy the wheel of the kind of an automobile that is needed for the police department. What we need is a big touring car that will carry a half dozen officers. No doll carriage for me! Reckon I'll stick to the old nag. He can't negotiate the New York to Paris race course, but he always gets round in time for oats. The police department needs a big car, which can carry enough detectives to handle a case in time of emergency. If the city's money is to be spent upon an automobile one should be provided that will prove serviceable."

The Week's Patents.

877,613. Driving Gear for Motor Road Vehicles. Percy G. Tacchi, Acton, London, England. Filed Nov. 18, 1905. Serial No. 287,956.

1. The combination with a casing, of an internally threaded sleeve carried by said casing, a driven shaft passing through said sleeve, an externally threaded sleeve mounted on said shaft with its threads in engagement with said internally threaded sleeve, a rack and pinion adapted to rotate said internally threaded sleeve on its shaft to move the same longitudinally, a clutch cone adapted to rotate the said internally threaded sleeve, means for preventing longitudinal movement of said clutch cone or said last mentioned sleeve and a driving shaft provided with a second clutch cone with which said first mentioned clutch cone may be engaged by the longitudinal movement of the sleeve.

877,709. Automobile Lift. Charles W. Gearing and William J. McGee, Franklin, Pa. Filed Aug. 29, 1907. Serial No. 390,595.

1. In an automobile lift, the combination with the floor of a garage, of channels let into said floor and adapted to receive the wheels of an automobile, and means for raising said channels.

877,711. Instrument for Indicating Speeds, Distances Covered, and the Like. Eugene V. Gratze, Leytonstone, England. Filed Oct. 16, 1906. Serial No. 339,221.

1. In combination, a substantially annular stationary magnet, a revolving core positioned between the poles of the magnet, a metallic casing adapted to embrace the core and extending beyond both sides thereof, spring means for controlling the rotation of the casing, indicating means operated by the casing, and means for rotating the core.

877,714. Combined Power Transmission and Automatic Mechanism for Motor Driven Vehicles. Thaddeus W. Heermans, Evanston, Ill. Filed Jan. 22, 1907. Serial No. 353,519.

1. In a motor driven vehicle, the combination with the motor driven shaft, the driven axle and power transmission connections between said motor shaft and driven axle, of an automatic brake mechanism cooperating with said power transmission connections, means whereby the brake mechanism is automatically operated to arrest the vehicle upon tendency of the load to drive the vehicle, and means for disconnecting the driven axle from said brake mechanism at a point between the axle and brake mechanism.

877,726. Vehicle Rim. Walter J. Nordlund, Oakland, Cal. Filed March 4, 1907. Serial No. 360,440.

1. A wheel rim comprising a fixed section and a movable section, said section having opposed interlocking cam surfaces, and a rotatable member operable between the fixed and movable sections and engaging both sections whereby one section may be moved axially relative to the other section.

877,730. Explosive Engine. Herbert R. Palmer, Cleveland, Ohio, assignor to The Palmer Oil Engine Company, East Cleveland, Ohio, a Corporation of Michigan. Filed Aug. 28, 1903. Serial No. 171,041.

1. In an explosion engine, in combination, a cylinder and piston, an explosion chamber upon said cylinder, a valve in said explosion chamber, means for conveying motor fluid adjacent to said valve, an injector plunger adapted to cross and thereby block the outlet for said motor fluid and at the same time inject an explosive charge of such fluid into said explosion chamber through said valve, and a variable cam for controlling said injector.

877,750. Motor Vehicle. Walter G. Windham, London, England. Filed Jan. 23, 1906. Serial No. 297,427.

1. In a motor vehicle the combination of a chassis, a front seat secured thereto and suitably disposed for the driver, longitudinal runners on the chassis, and a rear half-body detachable from the chassis by sliding rearwardly upon the runners, substantially as set forth.

877,762. Operating Device for Motor Vehicles. Pierre A. Darracq, Suresnes, France, assignor to Societe A. Darracq & Cie. (1905) Ltd., Suresnes, France. Filed March 29, 1907. Serial No. 365,323.

1. In a device for controlling change speed, reversing and brake parts for motor vehicles the combination of a frame, springs on said frame, a driving axle secured to said springs, a change speed a reversing and a braking device upon said axle, a pivoted balance beam on said frame, a fork connecting said balance beam and said axle, means upon said beam for pivotally supporting a plurality of levers, means connecting said levers to the devices upon said axle and means to enable the driver to operate said levers.

877,835. Combined Steering and Driving Axle. Paul Daniel, New York, N. Y. Filed March 12, 1907. Serial No. 361,930.

1. A motor vehicle, comprising a cross member adapted to support the vehicle body, a steering knuckle pivotally connected to each end thereof, wheels rotatably mounted upon said steering knuckles, a driving axle comprising a plurality of sections, one of said sections extending through one of the steering knuckles and having an enlarged end, and the other of said sections being connected thereto by a universal joint within said expanded end and anti-friction bearings intermediate said expanded end and said steering knuckle.

877,856. Spring Tire. Thomas J. McCarthy, Los Angeles, Cal. Filed March 27, 1906. Serial No. 308,197.

1. A wheel tire comprising concentric bands, one embracing and radially movable over the other and one of said bands fixed to the wheel, circumferentially arranged springs radially seated within and between said bands, fittings secured between said springs and said bands and provided with lugs at each corner, and two sets of diagonally disposed springs arranged side by side between each two of said radial springs and connected at their opposite ends with said lugs from the upper corner of one fitting to the lower corner of the other fitting.

877,924. Air Compressor Mechanism for Self-Propelled Vehicles. Ernest E. Hampton and Cicero G. Smith, Palisade, Colo. Filed Oct. 1, 1906. Serial No. 336,965.

1. In air compressor mechanism for vehicles, the combination with a moving part of the vehicle, of an air receiver mounted on the vehicle, and means actuated by the air in the receiver for automatically rendering the compressor mechanism inoperative when the air has reached a predetermined limit of compression within the receiver, said means comprising a cylinder, a piston

APPERSON BROS. AUTOMOBILE CO.,
Kokomo, Indiana. Members A. L. A. M.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

"I Wish They All Used Hartford Tires"

THE ARCHES
WIANNO
BARNSTABLE COUNTY, MASSACHUSETTS

September 17, 1907.

HARTFORD RUBBER COMPANY,
Hartford, Conn.

Gentlemen:-It gives me great pleasure to inform you how successful a season I have had with the Hartford Tires on my Fiat car--this being the fourth season AND THE BEST OF ALL. When I hear of the troubles my neighbors are having with other makes, I can only say I wish they all used the Hartford.

Yours truly,
GEO. N. TALBOT.

¶Our files literally bristle with letters like the above from enthusiastic users of Hartford tires. Especially do they dilate on the quality, on the freedom from trouble common to other tires, and general satisfaction. ¶Hartford Midgley Tread Tires afford the resiliency of ordinary tires and prevent the dangerous side slip.

1908 Stoddard-Dayton 1908

Stoddard-Dayton

A Creation of Real Motoring Economy

Run over the strong points of American cars that range in price from $4,200 to $5,000. Compare them with Stoddard-Dayton Model 8-F. The difference is as clear as rock crystal. It's IN THE PRICE.

Stoddard-Dayton

Model 8-F, 40-45 H. P. Motor, four cylinders cast in pairs, 4¾x5 inches. Selective type transmission, three speeds forward and reverse. Price $2,500, with oil lamps, horn and tool equipment, F. O. B. Dayton. Extras: Imported Bosch Magneto and double ignition system, $200; Pantasote or English Twill Top, $125; two additional folding tonneau seats, $50; Front lamps and brackets, $40; Prest-O-Lite tank, $35. We recommend 4½-inch tires for seven passengers, at extra cost of $15 per wheel. Car, complete with all extras as above, $3,000 F. O. B. Dayton. Send for 1908 Catalog.

SAVANNAH

Gave Two of Three Events to

Diamond TIRES

BOTH CASINGS AND TUBES

11 of 14 cars in three events used Diamond tires and changed 8 tires all told. On 3 cars with other makes, 8 tires were changed. On y one Diamond tire needs repairs. Four tires of other make need repairs.

SUPERIOR WEAR RESISTANCE OF DIAMOND TIRES WAS COMMENTED ON BY ALL. Note Annexed Telegrams

Savannah, March 20, 1908.

Congratulate you on Diamond tires and Marsh rims on which Apperson car won runabout race. Not a tire touched. Were used two weeks before race. In the 342 mile event Diamond tires and your demountable rims helped bring me from fifth place in 16th lap to second place at finish. We made time over rough places I would not have dared make on any tires but Diamond and they are in splendid shape at finish.

HERBERT H. LYTLE.

Diamond tires have once more done their share in another Thomas victory; winning of a Southern 6-cylinder cup.

H. E. COFFIN, Vice-Pres. E. R. Thomas-Detroit Co.
